2016 ASSESSMENT REPORT

ON THE

BREWERY CREEK PROPERTY

Registered Owner: Golden Predator Exploration Ltd.

Located in the Laura Creek Area

Dawson Mining District

Yukon Territory, Canada

NTS 116A-04, 116B-01, 115O-16

64 º 02’ Latitude

138 º15’ Longitude

Work (drilling) on claims Eel 59 and Eel 74 (YB17726 and YB17741)

Complete claim listing in Appendix 1

Prepared by: Golden Predator Exploration Ltd

Mike Burke, B.Sc., P. Geo

Date of Work: August 1, 2016 to August 31, 2016

Date of Report: May 28, 2017

Appendices

Introduction

The Brewery Creek Project is 100% owned by Golden Predator Exploration Ltd. The project was a producing heap leach gold mining operation as Viceroy Resource Corporation mined seven near-surface oxide deposits from 1996 through 2002, after which the mine shut down primarily due to low gold prices. In 2009, Golden Predator optioned the Brewery Creek property from Alexco Resource Corporation. In February 2012 Golden Predator signed a purchase agreement with Alexco to acquire a 100% interest in the project and all outstanding quartz claims subject to a 2% net smelter return royalty in favor of Alexco. In September of 2012 the purchase was completed and Golden Predator became the 100% owner of the Brewery Creek project.

This report describes a portion of the drilling program which occurred on the property during August of 2016. Drilling on the property in 2016 consisted of 14 HTW holes totaling 1223.5 metres directed at exploration targets in the South Thrust and West Big Rock areas. Five of the holes BC16-583, BC16-584, BC16-586, BC16-587 and BC16-588 were drilled on quartz claims and are eligible for assessment credit while the remaining eight holes were drilled on surface leases. Only the five holes drilled on the quartz claims are documented in this report.

An additional 12-holes totaling 634.1 metres were drilled for metallurgical testing, 3-holes totaling 314.6 metres for geotechnical work and 8-holes totaling 394.5 metres for water monitoring in the Lucky, Kokanee and Golden pit areas. This work is not documented in this report.

Property Location, Access and Claim data

The Brewery Creek property consists of an area of 181 square kilometres (km2), located in northwestern Yukon, approximately 55 kilometres (km) due east of Dawson City (Figure 1).

Figure 1 – Property location.

The property is centered at Latitude 64.041887° N and Longitude 138.206389° W or UTM NAD83 Zone 7N at 636,401 metres (m) E; 7,104,673 m N. The property is completely road accessible, and access is achieved by driving 40 km east on the North Klondike highway; 8 km north up the Dempster highway; then eastbound for 20 km along the North Fork road. The final 6 km to the mine site is maintained by the company, and is a dirt road.

Golden Predator Exploration Ltd., has a 100% interest in all 1,075 quartz claims, 93 of which have been converted to mining leases. Claims and leases are listed in Appendix 1, the expiry dates in the appendix includes work in 2016 which was filed for assessment credit but which has not yet been accepted. Figure 2 shows the claims and lease locations.

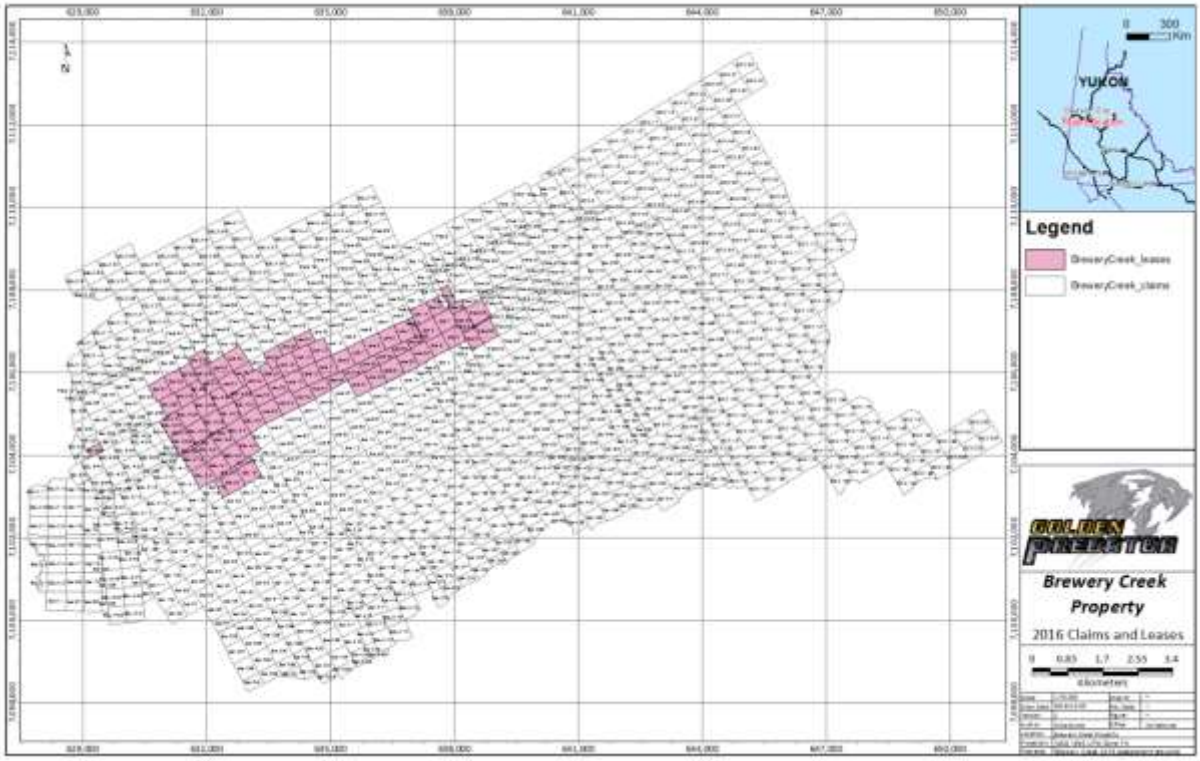

Figure 2 – Claim Map.

History and Previous Work

The initial claims for the Brewery Creek Project were staked by Noranda Exploration (Norex) in 1987 to cover a reconnaissance geochemical anomaly. Further claims were staked in subsequent years to cover possible extensions of gold mineralization.

In 1989, Norex entered into an agreement with Total Erickson Resources Limited (TERL). TERL provided Norex with $300,000 for exploration, and, in return, TERL earned a 5% NPR on 52 of the Brewery Creek Project area claims. In October 1992, TERL assigned all of its interests, rights, and title to Energold Minerals, Inc.

In September 1992, Hemlo Gold Mines, Inc. (Hemlo) acquired all of Norex's right, title, and interest to the Brewery Creek Project property area, including obligations to TERL. In 1993, Loki Gold Corporation entered into an assignment agreement with Hemlo, thus acquiring all of Hemlo's rights, title, and interest.

In May 1996 Loki and Baja Gold, Inc. joined to form a new company under the name Viceroy Minerals Corporation (Viceroy). Mine commissioning, production, closure and reclamation occurred under Viceroy ownership.

On May 1, 2003, an agreement among Viceroy, 650399 BC Ltd., Spectrum Gold Inc., and NovaGold Canada Inc. (NovaGold) was established in which Viceroy would allow 650399 BC Ltd an option to purchase mineral properties of, other rights to, and assets of the Brewery Creek Project. At this time, 650399 BC Ltd. (BC) was a wholly owned subsidiary of Spectrum Gold Inc. (Spectrum).

A small drilling program was conducted by 650399 BC Ltd. in 2004. Later that year, NovaGold acquired all of the outstanding shares of SpectrumGold and thus the option for assets of the Brewery Creek Project.

In April 2005, NovaGold relinquished the option for Brewery Creek Project claims and mining leases to Alexco Resource Corporation (Alexco) with a back-in clause following the completion of $700,000 of exploration expenditures by Alexco. NovaGold elected not to participate with this back-in option.

In 2009, Golden Predator signed an option agreement with Alexco whereby Golden Predator had the option to acquire up to 75% interest in 793 quartz claims and mining leases covering 127 km². A Purchase Agreement was signed between Golden Predator and Alexco in February 2012 and the sale was completed in September of 2012 by which Golden Predator purchased 100% ownership in the property.

In early 2013 Golden Predator Corp. changed its name to Americas Bullion Royalty Corp. (AMB) and in the process bundled the Canada based assets into Golden Predator Canada Corporation (Golden Predator), which exists as a wholly owned subsidiary of AMB.

Northern Tiger Resources Inc. and Redtail Metals Corp announced on December 17, 2013 that they have agreed with Americas Bullion Royalty Corp (AMB) to expand the terms of the previously announced Northern Tiger and Redtail merger (News Release October 28, 2013) to include the acquisition by Northern Tiger of AMB's Brewery Creek Project. On April 17, 2014 Northern Tiger Resources Inc changed their name to Golden Predator Mining Corp. and on April 21, 2014 announced that it had completed the acquisition of Brewery Creek in addition to all the assets of Golden Predator Exploration Ltd formerly known as AMB. For the purposes of this report Golden Predator Exploration and all its predecessor companies will be referred to as "Golden Predator".

Prior to the staking of the Brewery Creek claims in 1987 by Norex, there were no historical quartz claims recorded in the vicinity. RGS silt anomalies in the area were followed up with a reconnaissance geochemical survey, which the claims were originally staked for. Extensive geochemical and geophysical sampling in 1988 and 1989 were successful in identifying many of the mineralized zones. Between 1989 and 1999 over 175,000 metres of drilling and trenching was carried out (Galambos, 2010). The focus was to define the near surface oxide resources. Subsequent claims were later added to cover possible extension of gold mineralization. Prior to the Alexco Resources Corp. and Golden Predator agreement, Alexco optioned the property to SpectrumGold. In 2004, SpectrumGold undertook a drilling campaign designed to provide adequate information for structural interpretation in order to provide guidance for further exploration. A forest fire prevented completion of this program; however targets at the Blue, Blue East and South Pacific zones were tested.

In 2006 Alexco conducted a drilling campaign managed by NovaGold personnel. Nine HQ core holes were drilled totaling 1,171.53m. Drilling focused on Bohemian, Blue, Classic and an IP anomaly over the Classic fault.

From 2009 through 2012 Golden Predator completed 359 diamond drill holes totalling 51,576 metres and 210 Reverse Circulation holes totalling 33,397 metres.

Core drilling in 2009 was completed by Kluane Drilling of Whitehorse, YT, using a KDHT-1000 rig drilling NTW diameter core.

RC drilling in 2010 was conducted by Orbit-Garant of High River, AB, using an 11.4 cm (4½in) diameter bit and interchange system. All sampling was conducted at 1.52 metres (5 ft) intervals and drilling was conducted dry (without added water) until groundwater was encountered. A riffle splitter was used to reduce dry cuttings to a preferred 12.5% split for each interval. A hydraulic rotary splitter was used for sampling if/when wet drilling conditions occurred. Wet sample splits were targeted at the same 12.5% of cuttings as with dry sample splits.

Core drilling in 2010 was completed by Peak Drilling of Courtenay, BC. Peak used an EF-50 rig drilling HQ diameter core (63.5 mm). Core was drilled in 3 metres runs, each of which was oriented when possible, and placed appropriate, labeled core boxes.

RC drilling in 2011 was conducted by Boart Longyear of Calgary, AB, and Midnight Sun Drilling Inc. of Whitehorse, YT, using an 11.4 cm (4 ½ in) diameter bit and interchange system. All sampling was conducted at 2 metres intervals and drilling was conducted dry (without added water) until groundwater was encountered. A riffle splitter was used to reduce dry cuttings to a preferred 12.5% split for each interval. A hydraulic rotary splitter was used for sampling if/when wet drilling conditions occurred. Wet sample splits were targeted at the same 12.5% of cuttings as with dry sample splits. Field duplicates were generated by halving the 12.5% split sample material.

Core drilling in 2011 was conducted by Kluane Drilling or Whitehorse, YT and Peak Drilling of Courtenay, BC. Kluane Drilling used the KDHT-1000 described above, and a KD600, which also drilled NTW core but only with the capacity of 350 metres deep holes. Peak drilling used a Hydracore 2000 and an EF-50. Peak's EF-50 drilled HQ size core (63.5 mm) which had the capacity to drill to 760 metres.

In July of 2011 an 18 hole, sonic drilling campaign was conducted on the reclaimed leach pad. This program was designed to acquire information on the metallurgical characteristics of heap leach material as well as to collect data for a heap leach reactivation. The drilling was completed by Boart-Longyear out of Calgary, AB using a track mounted sonic drill. The machine drilled a 10 cm diameter hole by sonically advancing the core barrel followed by casing. Samples were extracted from the core barrel into PVC piping of the same diameter. Sonic sampling occurred at 1.52 metres (5 ft) intervals.

In 2012 3873.56m of diamond drilling, and 2282.9m of reverse circulation drilling were completed in 17 and 12 holes respectively. Drilling was completed by Kluane Drilling of Whitehorse, Matrix Drilling of Kimberley BC, and Midnight Sun Drilling of Whitehorse. Drilling was carried out in NQ (47.6mm), HQ (63.5mm), and NTW (56.0mm) sizes for core, and 4.5 inch diameter for RC drilling.

Historical Mining

Mineable oxide reserves were defined in 8 near surface pits along a strike length of 7 Km. The deposits were named, Pacific, Blue, Moosehead, Canadian, Fosters, Kokanee, Golden and Lucky, west to east consecutively. The "Reserve Trend" which is a 7 km ENE trend is part of a large 15 km soil anomaly which extends more or less WNW. The 7 oxide reserves line up along this ENE Reserve trend. In total,

9.7 million tonnes of oxide reserve were mined, grading 1.44g/t Au (Galambos, 2010). The mine was in operation from 1996 until 2002, with infrastructure and mine construction commencing in 1995. In total, 279,541 ounces of gold have been produced at Brewery creek.

The first gold pour was completed on November 15, 1996. In 1999 production from the mine fell and cash costs soared. As well, the price of gold fell to its lowest averaged yearly value since prior to 1979. Viceroy thus suspended all seasonal mining activity earlier than planned and brought in an independent consulting firm to study the recovery process and conduct extensive exploration to identify additional reserves. In the year 2000 Viceroy concentrated on mining the ore bodies which were most oxidized and of highest grade. Mining ceased in 2001, however heap leaching continued for that year, producing 18,542 ounces.

Mineral Resource Estimate

Indicated and inferred resource estimates have been produced for fourteen deposits plus the former heap leach pile. Resources are reported for both oxide and sulfide material. Indicated oxide resources (including historical heap leach pad) total 577,000 troy ounces of contained gold in 14,152,000 tonnes of material at 1.27 g/t Au. Inferred oxide resources (including historical heap leach pad) total 279,000 troy ounces of contained gold in 9,309,000 tonnes of material at 0.93 g/t Au. Indicated sulfide resources total 142,000 troy ounces of contained gold in 3,459,000 tonnes of material at 1.28 g/t Au. Inferred sulfide resources total 546,000 troy ounces of contained gold in 12,408,000 tonnes of material at 1.37 g/t Au.

Geology

Regional Geology

The Brewery Creek property is located at the foothills of the Ogilvie Mountains along the northeastern portion of the Tintina trench. The Tintina trench delineates the Tintina fault which, in the district around Brewery Creek, positions accretionary terranes of the Canadian Cordillera up against Selwyn Basin sediments. The Selwyn Basin sediments are composed of late Proterozoic and Paleozoic sediments which collected within the offshore basin of the old continental margin of ancient North America. Cordilleran rocks which lie to the southwest along the Tintina fault consists mainly of Yukon-Tanana Terrane rocks, such as polymetamorphosed and polydeformed metasedimentary, metavolcanic and metaplutonic rocks of the upper Paleozoic. A regional geology map of the area can be seen on figure 3.

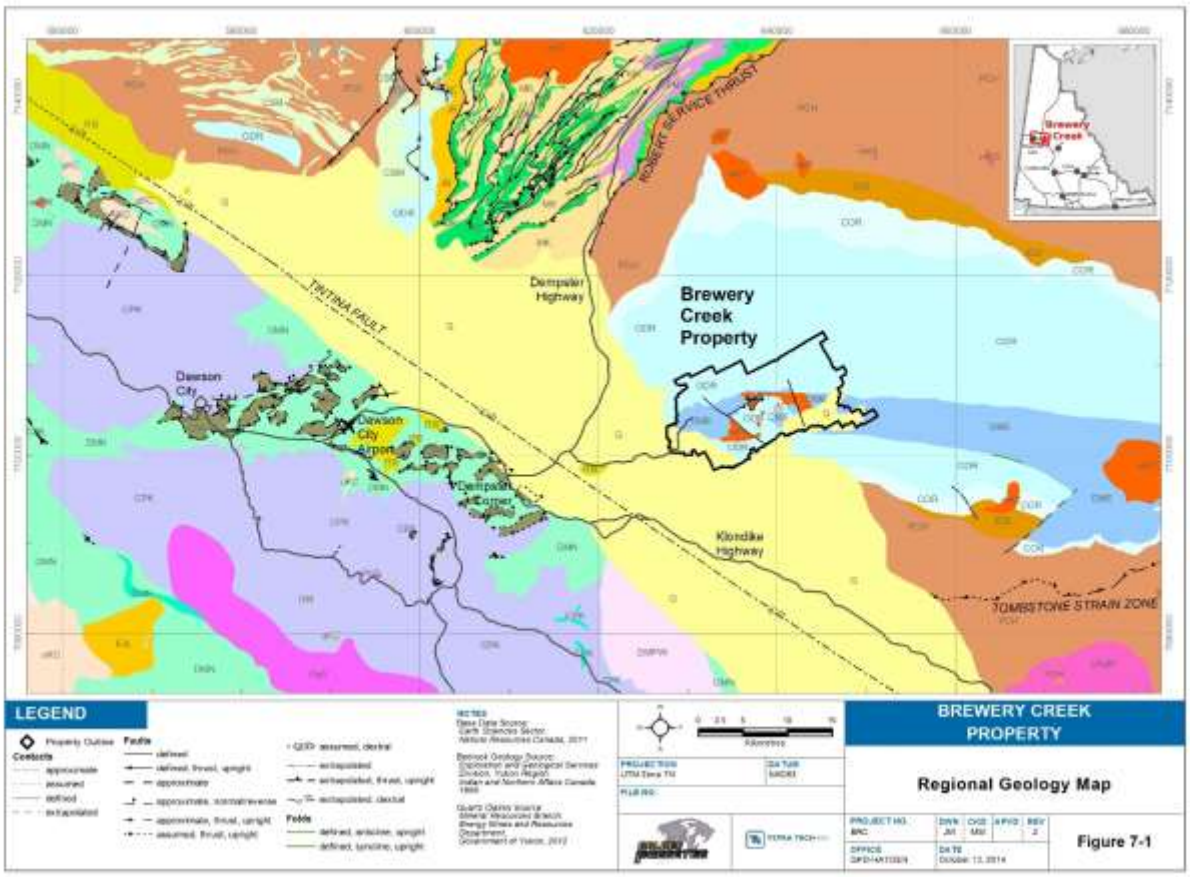

Figure 3 – Regional Geology

Within the Selwyn Basin, rocks have been polydeformed and imbricated by the Jurassic- Cretaceous Dawson, Tombstone and Robert Service Thrust faults. The Robert Service Thrust fault carries the bulk of the Selwyn Basin rocks, including those found on the Brewery Creek property in its hanging wall. This stratigraphy includes sequences of Hyland group, Cambrian- Ordovician Road River Group, and Devonian-Mississippian Earn Group sediments. These groups, the Hyland, Road River and Earn are all cut by and intruded by Cretaceous aged intrusive rocks of the Tombstone Plutonic suite. These intrusive rocks form a northwest striking belt of siliceous stocks and plutons, which parallel the lateral extension of the Tintina Trench. This intrusive suite can be traced for 350 kilometres to the southeast, from Dawson City to the Yukon – Northwest Territories border. Metallurgical associations include Au, Ag, Bi, Mo, W, Sn, Cu and other base metals.

Property Geology

A map of property geology can be seen on figure 4.

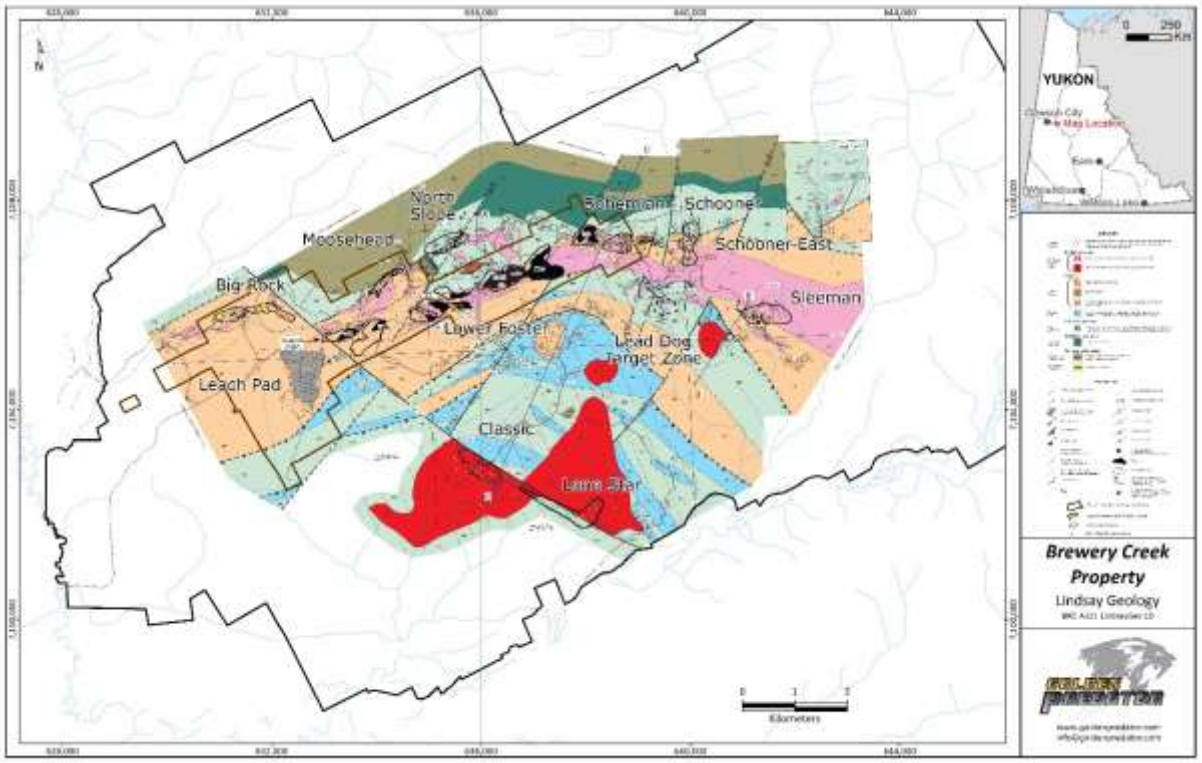

Figure 4 – Property Geology

Stratigraphy

The stratigraphy at Brewery Creek is as follows from oldest to youngest: Rabbitkettle Formation, Menzie Creek Volcanic (informal), Road River Group, Brewery Unit (informal) and the Earn Group. These formations are described below.

Rabbitkettle formation

This unit consists of cream to white weathered calcareous phyllite, which is generally a thinsequence which is tightly folded and interbedded with mm scale chert and mudstone. The unit is bound by a thrust fault up against the Earn Group to the west. The formation is conformably overlain by a thin sequence of Road River Group volcanics.

Menzie Creek volcanic

The Menzie Creek volcanic unit, a thick weathered mafic volcanic unit, outcrops in the northern portion of the property, near the Moosehead zone. The unit is a chlorite-carbonate rich medium grained basalt

to amygdaloidal basalt. The Menzie Creek volcanic unit is either fault bound or lies unconformable over the Rabbitkettle Formation and the Road River group lie on the upper boundary.

Road River Group

The Road River Group is one of the most prevalent sedimentary units found throughout the property, and is an important marker unit when it comes to defining the location of intrusive sills. The Ordivician-Devonian age unit, which overlays the Menzie Creek Volcanic, consists of black chert and tan weathered wispy laminated siltstones. The group is broken up into the Duo Lake formation and the Steel formation. The Duo Lake Formation, which outcrops to the northeast of the property, consists of grey/black chert and siliceous siltstones. Thickness of the beds range from 2-100 cm. The Steel formation is composed of tan weathered, wispy laminated, and burrow marked calcareous siltstones and shale. The boundary between the Steel Formation and the Earn Group/Brewery unit was one that is exploited by intrusive sills, thus leading to the mineralization of some favorable siltstones within the formation.

Brewery Unit

The Brewery Unit is not yet formally recognized, however it appears at the Blue pit and Classic zones of Brewery Creek. Lying between the thick laminated siltstones, shale and mudstones of the Steel Formation, and the siliclastic and variably carbonaceous argillites of the Earn group, the Brewery Unit consists of siltstones, chert and limestone. This unit is rich with fossil fragments (mostly crinoid stems) interbedded in the siltstone and chert layers. The limestone unit may play a pivotal role in exploration targets as it reacts with the hydrothermal fluids that mineralized the Brewery Creek property.

Earn Group

The Earn Group is another dominant sedimentary unit found throughout Brewery Creek. The Devonian age sediments lie unconformably over the Steel Formation over much of the Selwyn Basin, however at Brewery Creek there are many locations where the Brewery unit lies in between the two. The lower stratigraphic section of the Earn Group contains fine-grained deep basin sediments, mostly argillite which ranges from graphitic to non-graphitic in nature, over metre scale sections. The upper stratigraphic section of the Earn Group contains coarser, clastic sedimentary units such as chert pebble conglomerate and sandstone. Locally, the fine-grained unit is baritic in nature. This bedded barite can be found at the northern portion of the property near the North Slope zone.

Intrusive Rocks

The stratigraphy at Brewery Creek has been intruded by Tombstone Plutonic Suite intrusions of Cretaceous age. Intrusive rock types include latite porphyry, monzonite, quartz monzonite porphyry, biotite monzonite, syenite, alkali feldspar syenite with a minor hornblende gabbro outcropping in the Golden pit. The monzonite sequence of rocks has intruded the upper Road River (Steel formation) and lower Earn Group stratigraphy as semi-conformable sills over a 15 km strike length. Shear fabrics within the graphitic argillite is associated well with sill intrusion, and indicates the monzonite intruded early Cretaceous thrust faults. Sill thickness varies from 5 to 100 metres.

In the Sleemans area younger monzonite dikes cut the older intrusions. The dikes are biotite bearing with no free quartz or hornblende and have a much finer grained texture. Where these dikes are altered the feldspars are converted to clay and biotite to white mica/clay. The intrusions at the Classic and Lone Star areas of the property appears to manifest more as a large intrusive stock, composed of multiphase alkalic intrusions, ranging from pyroxene syenite and diabase, which cut equigranular syenite and biotite

monzonite. The stocks crosscut sedimentary bedding and local tremolite-epidote-diopside-garnet-skarn is developed marginal to the intrusives in contrast to the Reserve Trend sill complex.

Mineralization

Mineralization at Brewery Creek occurs most commonly as fracture and fault controlled disseminations and veins within the cretaceous monzonite sills. Throughout the “Reserve Trend”, or 15 km strike length of semi conformable monzonite sills, gold occurs predominantly within the sills, and some favorable sedimentary units (siliclastic Road River/Earn group). Along the reserve trend gold is associated most commonly with disseminated arsinian pyrite and quartz-carbonate arsenopyrite veins and alteration haloes. The close ties to sulphide grains results in the majority of the exploration and mining work to be focussed on the oxide zones of the reserve trend (weathered part of the mineralized system). Within this zone, the sulphide grains have oxidized and the gold is left free hanging around what were once sulphide grains. At the Classic and Lone Star zones gold is hosted in multiphase alkalic intrusions, as mentioned above. Gold occurs from steep dipping cm scale sheeted quartz-pyrite-arsenopyrite-gold veins, to disseminated/blebby arsenopyrite within the mafic matrix of coarse grained syenite. Bottle roll tests with both oxide and unoxidized material at Classic yield high gold recoveries, indicating the possibility that the gold is free.

Historical production on the property occurred along the historical BCRT. The Brewery Creek District consists of numerous deposits, mineralized zones and past producing deposits both along this trend as well as within peripheral mineralized areas. Past producing areas within the BCRT include the Pacific, Blue, Canadian, Upper Fosters, and Kokanee, Golden and Lucky deposits. Additional to these, Mineral Resources have been defined for the Big Rock West, Big Rock East, Lower Fosters, Bohemian and Schooner deposits along the BCRT; the North Slope deposit north of the BCRT; Sleeman deposit east of the BCRT, and the Classic and Lone Star deposits south of the BCRT. Figure 5 shows the locations of the significant mineralized zones.

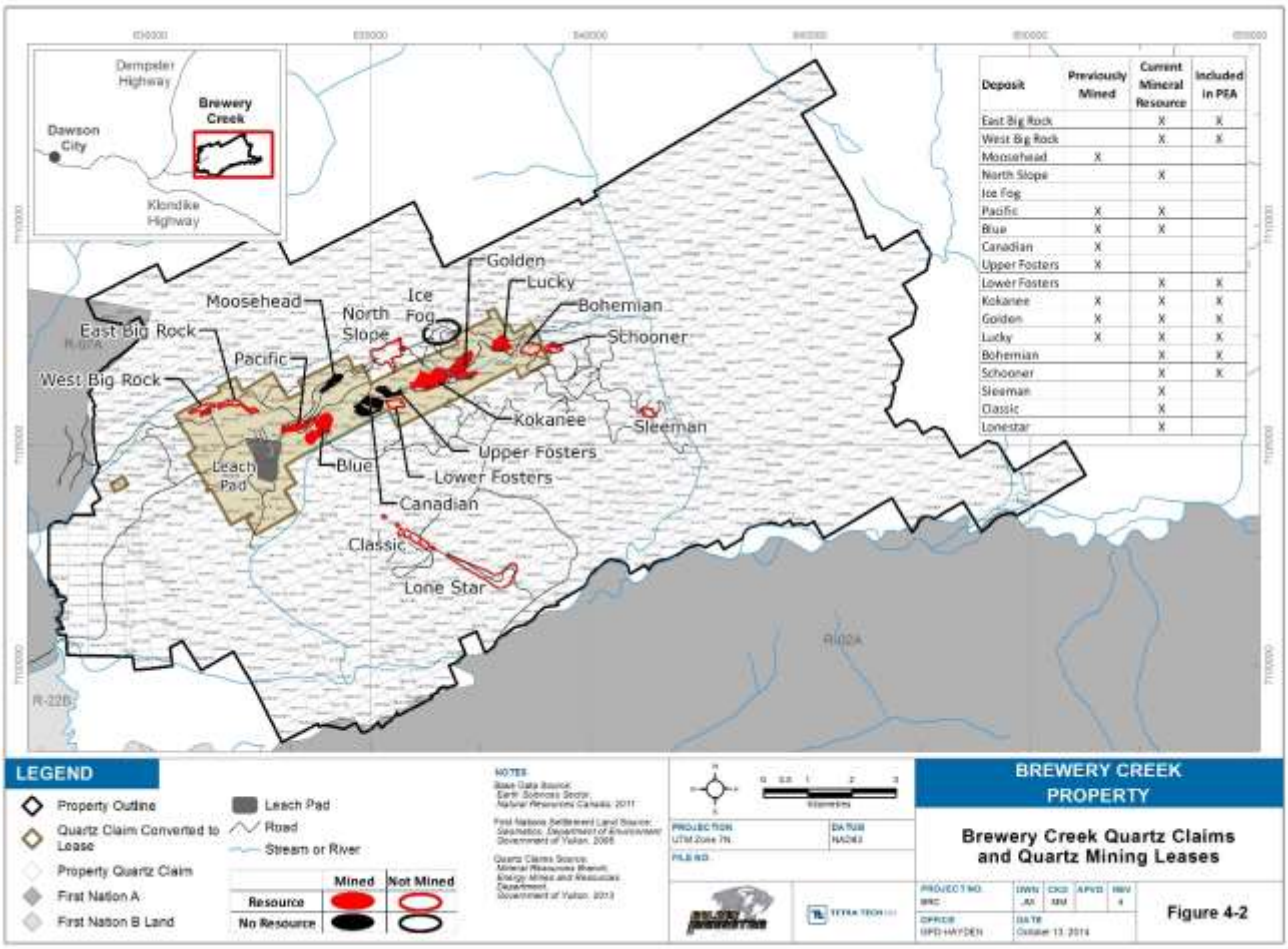

Figure 5 – Significant Mineralized areas.

Structural Geology (Excerpt from Simpson 2009)

Paleozoic sedimentary strata at Brewery Creek form a homoclinal sequence that strikes approximately 070° AZ and dips moderately southeast. The sequence displays tectonic fabrics and geometries that indicate polyphase deformation including thrust faults that strike approximately 070° AZ, and folds. Earlier workers describe multiple generations and orientations of folding (Lindsay, 2006; Diment and Simpson, 2009); work completed by Golden Predator has not verified these features. At least three orientations of high-angle faults formed subsequent to thrust faulting, one that strikes northwest, one northeast, and the other parallels the 070° AZ thrust faults but dips more steeply. All of these fault sets, described below, influence or control the distribution of ore.

Thrust Faults

Stratigraphic repetitions best define the positions of thrust faults at Brewery Creek. Many were mapped by earlier workers along the reserve trend (Diment and Simpson, 2009). The faults generally strike east-northeast (±070° AZ), dip moderately southeast, and commonly place siltstone of the Steele formation above variably graphitic and locally baritic argillite of the Earn group. Graphitic argillite typically occurs within and along the fault zones and defines the zone of displacement. The argillites typically display

well developed tectonic fabrics. Regional work by Murphy (1997) shows that thrust faulting took place between late Jurassic and mid-Cretaceous time based on the age of the youngest stratigraphy cut by the thrust faults and a 142 ±6 ma date on muscovite in the Tombstone Strain Zone, a cross cutting structural feature. The Jurassic date is consistent with thrust faults mapped regionally in the Brooks Range (Pflaker, 1994).

The Brewery Creek sill complex intrudes and lies in proximity to the thrust faults but shows no evidence of thrust faulting. Apparently the sills are younger than the latest movement on the faults and appear to have utilized them as an intrusive plumbing system.

High Angle Faults

At least three families of high-angle faults occur at Brewery Creek, one strikes northeast, one northwest, and the other east-northeast. The northeast and northwest sets show a strong component of strike displacement and post-ore displacement. The east-northeast striking structures show primarily dip-normal displacement.

Northwesterly structures generally have a strike azimuth of approximately 330° and are near vertically dipping. Relationships visible in outcrop in the Kokanee open pit show that they displace ore in a dextral sense. They commonly show a magnitude of displacement of a few to tens of meters, and based on field relationships, we interpret some of the larger ones to have displaced up to a few hundred meters. Lindsay (2006) suggests greater dextral displacement along the 300° striking Classic Fault. He interprets that mineralization along the Reserve Trend displaced dextrally a distance of 1.5 kilometers. The northeast structures have azimuths of 020° to 030° and are generally near vertically dipping. Fault fabrics indicate that the primary direction of displacement is horizontal. Where confirmed by outcrop relationships, they show left-slip displacement. The magnitude is more difficult to interpret than the northwesters; ore zones commonly form along this structural grain, but it is unknown whether the fault displaced ore or whether mineralization formed in response to plumbing provided by faulted rocks.

East-northeast-trending faults occur throughout the district. They generally have an azimuth of 070 ° and dip steeply to the northwest. Outcrop relationships in the Kokanee open pit show that they are normal faults that displace rocks down to the north-northwest. Displacement is generally small; where observed in outcrop, less than 10 meters. Closely spaced joint sets commonly parallel these faults.

Tectonic fabrics within fault zones exposed in outcrop demonstrate that the northeast and northwest structures were co-active, and their strikes are consistent with a conjugate set. The faults cut the Brewery Creek sill complex so experienced the most recent movement subsequent to sill intrusion at approximately 90 to 92 ma. Minor and small-scale quartz-sulfide veinlets and stockworks with 330° azimuths were observed in the hangingwall of a northeast-striking fault in the Golden deposit, suggesting that the 330° AZ orientation was active during mineralization. No major mineralized zones, except Classic, follow the northwest orientation, indicating that, though active, it was not strongly dilatant during mineralization. Several large deposits and mineralized zones, including parts of the Kokanee and Golden deposits, follow mapped northeast-striking faults, indicating that the northeast orientation was active and strongly dilatant during mineralization. The northwest-striking faults show the greatest amount of post-ore displacement.

2016 Exploration Drilling Program

The 2016 drilling program was conducted out of the Brewery Creek camp. Kluane Drilling of Whitehorse conducted the drilling using a K1000 skid mounted drill drilling H thin wall (HTW) core. Chief Isaac Corp of Dawson was contracted to open the camp and to provide cooking and cleaning staff during the program. Golden Predator staff consisting of geologist Neil Swift or contractor Mike Maslowski P. Eng provide on-site management of the program. Exploration drilling in 2016 was directed mainly in the West Big Rock Zone in addition to two holes in the South Thrust zone. A total of 14 holes and 1223.5 meters were drilled for all exploration. The drilling encountered unforeseen technical problems in some areas requiring reduced lengths of holes, primarily due to higher water flows and bad ground. Holes BC16-583 and BC16-584 were drilled in the South Thrust zone (Figure 6), holes BC16-586, 587 and 588 were drilled in the West Big Rock zone (Figure 7) and are documented in this report.

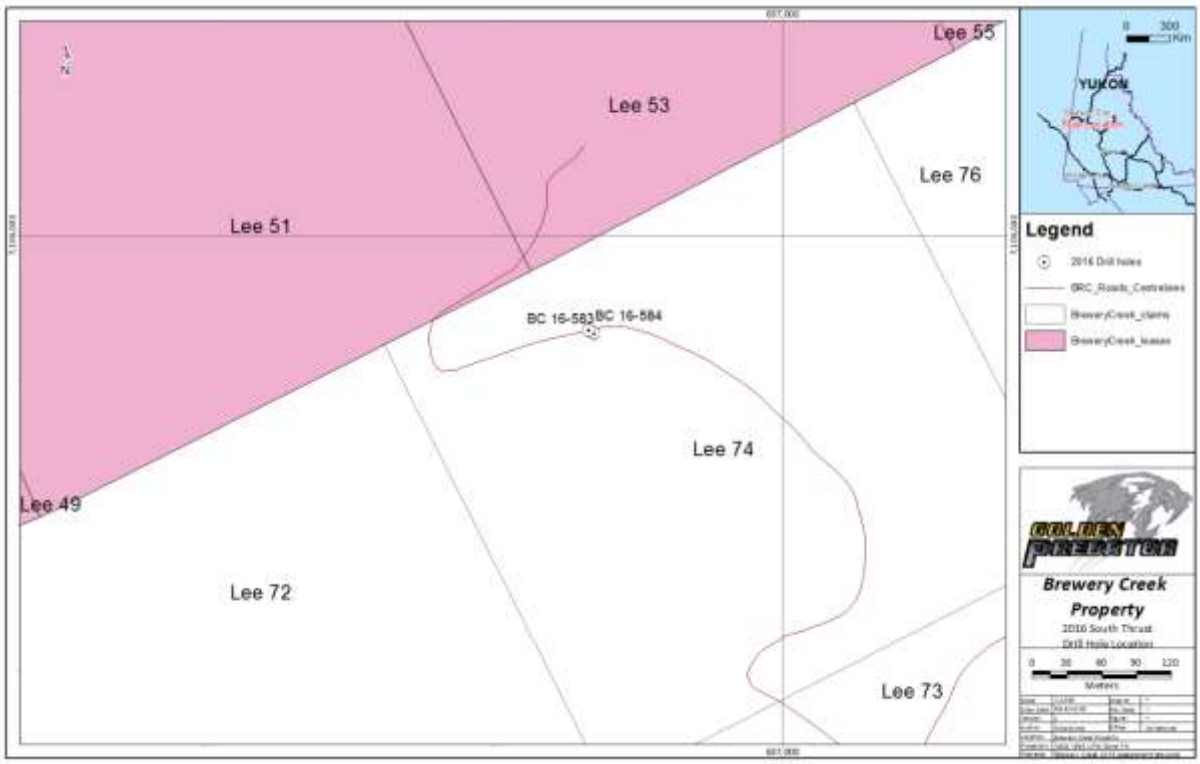

Figure 6 – Location of South Thrust drill holes

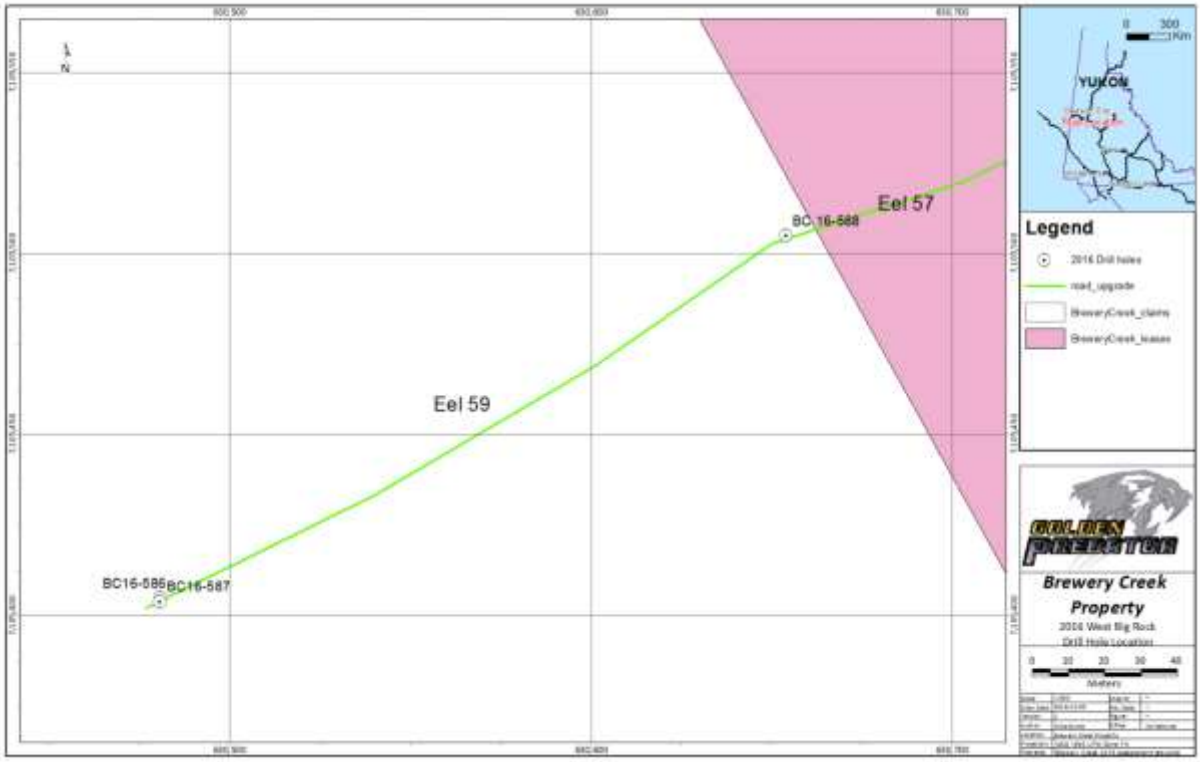

Figure 7 – Location of West Big Rock drill holes.

The West and East Big Rock deposits are the farthest west known occurrence in the district and are located approximately 1.2 km from the current heap leach pad. They were discovered in the early 1990's by Viceroy Gold by soil sampling and trenching. The two zones were first drilled in 1991; most of the drilling was carried out between 1994 and 1998. The deposits are defined by 213 reverse-circulation rotary holes, and 69 core holes, totaling 22,288 metres of drilling. The West Big Rock deposit is ~650 metres in length, ~30 metres wide, and ~220 metres down dip. The East Big Rock deposit is ~640 metres in length, ~30 metres wide and ~180 metres down dip.

Mineralization in the Big Rock zones occurs primarily in limonite-altered quartz monzonite sills and subordinately in adjacent siliciclastic sedimentary strata. Big Rock sills strike 070° azimuth and dip between 40 and 45 degrees southeast and have a drill-defined strike length of approximately 1.5 km. The eastern part of the sill complex and deposit are truncated by the Classic fault, or a splay. Lindsay (2006) suggests that Big Rock mineralization is a westerly continuation of the BCRT that is displaced approximately 1.5 km to the northwest by the Classic Fault. An alternate interpretation is that these deposits represent the westerly continuation of a mineralized trend which parallels the BCRT to the northwest, between the Big Rock resources and the North Slope mineralized zones. No other faults were mapped or modeled in the Big Rock resource area. The westerly extension of the West Big Rock zone remains open. Soil geochemistry is muted in the westerly extent due to quaternary cover increasing in thickness to the west. Drilling in 2016 was directed at testing the postulated westerly extension of the West Big Rock deposit.

Geologically, the South Thrust zone occupies a large (4 km long) north east trending southerly dipping thrust fault. This fault juxtaposes Silurian/Devonian Steel formation overtop Devonian Earn group sediments. Similar to the Reserve Trend's basal fault, the South Thrust fault strikes north-east/south-

west and dips to the south, initially steep but shallows out. It is these faults that likely provided the structural preparation for monzonite emplacement of the reserve trend, and for mineralization localization.

Though under-explored, the South Thrusts structural similarity likely provided the same mechanisms for mineralization and possible sill emplacement. No sills are mapped in the area, however Golden Predator intersected a monzonite in BC12-570 and BC12-571. Similar to the Pacific and Blue pits, the sills beneath were barren of gold, however the sediments above are gold bearing.

Hole **ID**	**From (m)**	**To (m)**	**Au g/t**	**Interval (m)**
BC12-570	14.00	74.00	0.4	60.00
Including	44.00	66.00	0.5	22.00
BC12-571	70.00	114.00	0.3	44.00
Including	74.68	86.68	0.5	12.0
And	106.00	114.00	0.7	8.00

Table 1 – 2012 South Thrust drill intersections

Drill holes BC16-583 and BC16-584 were drilled 1.2 km west from BC12-571 (Figure 8).

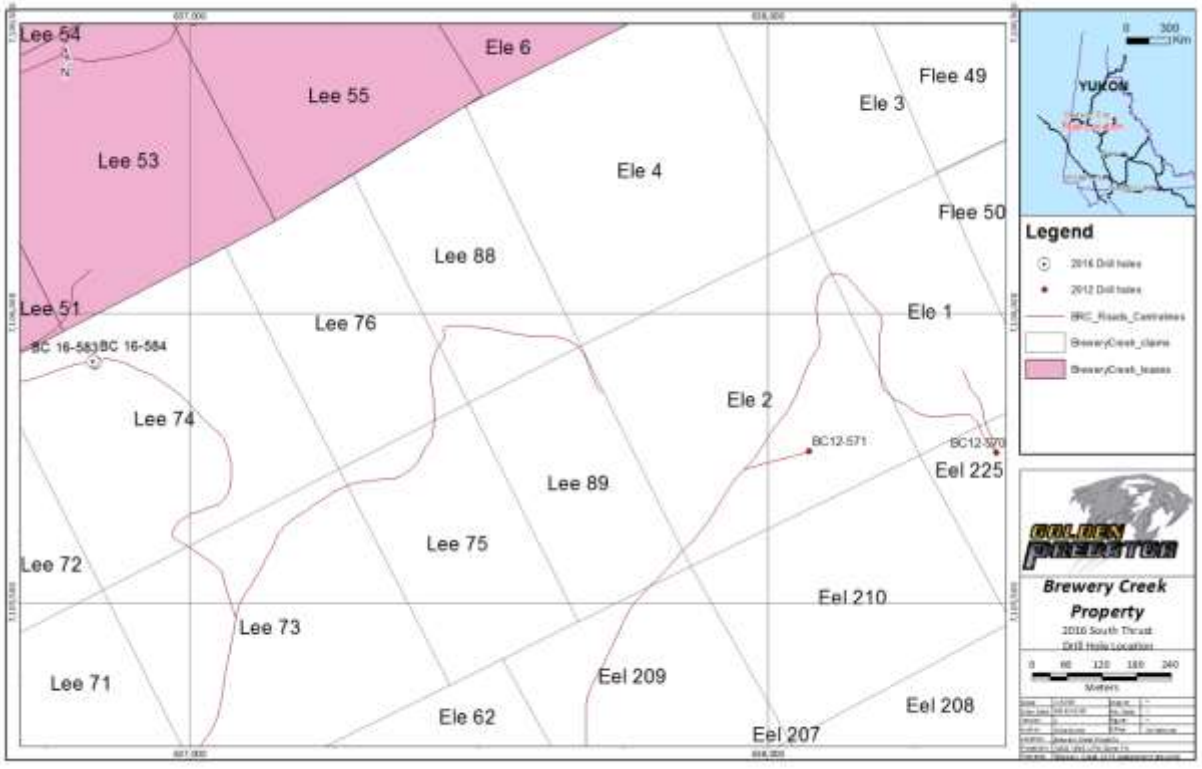

Figure 8 – 2012 and 2016 South Thrust drill locations.

Sample Preparation and Analysis

Drill core was delivered at the end of each shift to the core logging facility in the Brewery Creek camp. Core was logged, photographed then split longitudinally using a diamond rock saw. One half of the split is placed in the sample bag, and the second half is placed back in the core box for future analysis. The one half that stayed on property was kept behind the core storage in sealed boxes. Samples were shipped directly to ALS Chemex preparation laboratory located in Whitehorse, Yukon.

Samples were analyzed by ALS Chemex Laboratories. The following are descriptions of analytical methods are from the companies themselves. The core samples were sent to ALS Mineral's ISO 9001 certified preparation facility in Whitehorse. The pulps were analyzed at ALS's ISO 9001 certified laboratory in Vancouver. Blanks, commercial standards and duplicate samples were included in each batch. To determine gold levels at the ppb level detection limit 5-10,000 ppb 30 g samples are fire assayed, then digested in aqua regia solution and analyzed by atomic absorption. Values over 10 g/t gold are re-assayed by fire assay followed by a gravimetric finish (50 ppb lower detection limit). ALS Fire Assay Procedure – Au-AA23 Fire Assay Fusion (FA-FUS01 & FA-FUS02), Atomic Absorption Spectroscopy (AAS) Finish; Au-AA13. A prepared sample is fused with a mixture of lead oxide, sodium carbonate, borax, silica and other reagents as required, inquarted with 6 mg of gold-free silver and then cupelled to yield a precious metal bead. The bead is digested in 0.5 mL dilute nitric acid in the microwave oven, 0.5 mL concentrated hydrochloric acid is then added and the bead is further digested in the microwave at a lower power setting. The digested solution is cooled, diluted to a total volume of 4 mL with de-mineralized water, and analyzed by atomic absorption spectroscopy against matrix matched standards. Samples which assayed over 0.2 g/t Au were followed up with an Au-AA13 assay to determine cyanide leachability as well as PregRob characteristics. Au-AA13 establishes the potential gold cyanide extraction efficiency, which, due to the sulphide nature of the transition ore and unoxidized zones, is important in discerning which material will be best suited for application to the leach pad. The sediments at Brewery Creek had previously been characterized as PregRobbing material; that is, during cyanide leaching, leached gold is absorbed by certain components of the ore, and is thus not received. This is true of certain portions of the sedimentary units within the Brewery Creek deposit, but not all units have this problem. Proximity to the intrusion, or possibly the location of the paleo-water table has all been thought to have contributed to the pregrobbing nature of the carbon rich (graphitic) argillite units.

Discussion and Conclusions

Drill hole BC16-583 and BC16-584 were drilled from the same setup along a pre-existing road which is interpreted to cut the trace of the South Thrust. The site was selected due to limited areas available for drilling without conducting drill pad building that was beyond the capabilities of the equipment on-site. The holes are near trench TR98-SC4 which intersected 0.28 grams per tonne gold over 4.0 metres in a quartz monzonite dyke/sill that was exposed in colluvium. Weak gold in soil geochemistry exists in the area which is dominantly underlain by Earn Group shale and siltstones. Both drill holes intersected a mixed package of Earn Group siltstones and argillites intruded by multiple quartz monzonite sills that varied from 0.3 metres in thickness up to 14.4 metres. The quartz monzonite sills were variably oxidized

and were relatively competent. Neither drill hole intersected significant gold mineralization although sampling was selective and portions of the drill holes remain un-assayed.

The drill holes were potentially drilled in the footwall (north) of the South Thrust and although they intersected quartz monzonite sills they may have missed the target. Exposure in the area is very limited. Road River Group calcareous siltstones are mapped just to the south of drill hole BC16-583 and 584 and this stratigraphy may represent a more attractive target where intersected by the thrust. The role of high angle faulting in controlling mineralizing fluids at Brewery Creek is evident in blast hole data within the main reserve trend. Exposure in the South Thrust area is poor and identification of high angle faulting intersecting the South Thrust and the quartz monzonite sills emplaced along it also represents an unexposed target.

Detailed geophysics such as Induced Polarization should be considered to provide targeting in the South Thrust area where exposure is limited.

Holes drilled to the west of West Big Rock were successful in intercepting numerous intervals of oxidized and non-oxidized quartz monzonite. The best hole was BC16-594 which encountered 55.5 meters of 0.59 g/t gold with an interval near the bottom of this hole with of 7.8 meters at 2.55 g/t gold. This hole was drilled on Eel 57 which is covered by a surface mining lease. Hole BC16-594 was drilled to the south-southeast towards an older RC hole, RC-2461, which encountered a long intercept of gold mineralization as well. The results are confirming an area with a large zone of gold mineralization that still remains open down dip. Hole BC16-588 is located approximately 290 metres west of BC16-594 and hole BC16-586 and 587 approximately 500 metres west of hole BC16-594.

Drill hole BC16-586 was drilled at an azimuth/dip of 300/-60 and intersected dominantly quartz monzonite sills which were variable oxidized and limonite altered. A minor amount of sheared and broken argillite was intersected. The hole also intersected a 4.0 metre biotite monzonite dyke near the bottom of the hole before it was terminated at a depth of 53.34 metres due to high water flow from an interpreted fault zone. An 11.2 metre limonite altered quartz monzonite sill was intersected from 21.8 to 33.0 metres. The sill was incompetent and intensely limonite altered. From 23.5 to 28.0 metres the sill returned a value of 1.31 grams per tonne gold over 4.50 metres including 1.50 metres grading 2.55 grams per tonne.

Drill hole BC16-587 was drilled from the same set-up as hole 586 but at a slightly different azimuth/dip of 350/-80. The hole intersected a mixed package of argillite and quartz monzonite sills which were less altered than those in hole 586. The hole intersected weak mineralization from 32 to 33.5 metres which assayed 142 ppb gold within a weakly altered quartz monzonite dyke from 30.65 to 41.25 metres. A biotite monzonite dyke was intersected from 28.5 to 30.0 metres depth. This hole was terminated at a depth of 47.24 metres when it intersected a fault zone.

Drill hole BC16-588 was drilled at an azimuth/dip of XXX/-60 and intersected a mixed package of biotite monzonite and limonite altered quartz monzonite sills intruding graphitic argillites. The hole was terminated at a depth of 67.06 metres in a fault zone in argillites. No anomalous gold was intersected in the hole.

Drilling in the West Big Rock zone was successful in intersecting gold mineralization with economic widths and grades. The quartz monzonite sills extend to the west so the potential to extend the West Big Rock deposit remains open to the west. A more methodical drill campaign which drills fences of holes across the zone should be conducted to trace the mineralization to the west of the current resource.

Appendix 2

CERTIFICATE OF AUTHOR

I, Michael R. Burke, P.Geo., hereby certify that:

I am currently Chief Geologist for Golden Predator Mining Corp. I am not independent of Golden Predator Mining Corp., as described in Section 1.5 of NI 43-101.

I graduated from University of British Columbia, Vancouver B.C., in 1987 with a Bachelor's Degree in Science (B.Sc.), in the field of Geology.

I have practiced my profession as a Geologist for the past 29 years since graduation, and I have been involved in exploration for precious and base metals in Yukon and British Columbia.

I am a registered as a Professional Geoscientist (P. Geo.) in the Province of British Columbia (No 42955).

I have prepared this report titled 2016 ASSESSMENT REPORT ON THE BREWERY CREEK PROPERTY

Dated at Whitehorse, Yukon. this June 2nd, 2017

Respectfully submitted,

"Signed"

Michael R. Burke, P.Geo

CERTIFICATE WH16139952

Project: Brewery Creek

P.O. No.: Shipment #3

This report is for 83 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 23- AUG- 2016.

The following have access to data associated with this certificate:

MIKE MASLOWSKI	BILL SHERIFF	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
SPL- 34	Pulp Splitting Charge
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
LOG- 21	Sample logging - ClientBarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 22Y	Split Sample - Boyd Rotary Splitter
PUL- 31	Pulverize split to 85% <75 um
LOG- 23	Pulp Login - Rcvd with Barcode
LOG- 21d	Sample logging - ClientBarCode Dup
SPL- 22d	Duplicate split - rotary splitter
PUL- 31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au- AA23	Au 30g FA- AA finish	AAS
Au- AA13	Au by cyanide leach and AAS	AAS

To: GOLDEN PREDATOR MINING CORP.
ATTN: MIKE MASLOWSKI
#510 - 580 HORNBY STREET
VANCOUVER BC V6C 3B6

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH16133272

Project: BREWERY CREEK

This report is for 48 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 13- AUG- 2016.

The following have access to data associated with this certificate:

MIKE BURKE BILL SHERIFF	JACK COTE NEIL SWIFT	MIKE MASLOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 23	Pulp Login - Rcvd with Barcode
CRU- QC	Crushing QC Test
LOG- 21	Sample logging - ClientBarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 22Y	Split Sample - Boyd Rotary Splitter
PUL- 31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au- AA23	Au 30g FA- AA finish	AAS
Au- AA13	Au by cyanide leach and AAS	AAS

To: GOLDEN PREDATOR MINING CORP.
ATTN: NEIL SWIFT
#510 - 580 HORNBY STREET
VANCOUVER BC V6C 3B6

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.
