Summary

This report documents work done on the Barker property in the 2016 field season. This property is approximately 100 km south of Dawson and is fully owned by White Gold Corp. It lies south of the Stewart River; the closest corner of the property is 1km away from the Stewart.

Access to the property is mainly helicopter supported. There are placer mining roads in Barker Creek but no access to main territorial highways. Barge access is available at adjacent Thistle landing and airstrip.

Before 2016 Barker was a portion of the Whiskey property, specifically the Rye, Oak and Water groups of the Whiskey (Dennis Arne, 2010). The claim name changed when ownership was taken over by White Gold Corp.

Very little mineral exploration occurred on the Whiskey Property prior to Smash Minerals 2010 field season. The work done on the Barker portion (Rye, Oak, Water) of the property in 2010 consisted of 42 rock samples and 2,326 ridge-spur soil samples

The work done in 2016 consisted of XCAM aerial imagery and soil sampling. XCam was able to capture approximately 300 square km's of aerial imagery. The property was split into two missions, east and west, that were flown on October 24th. This will provide as a useful tool for planning and operating future exploration on the Barker property.

A total of 3115 soil and representative samples were taken between September 20th and October 15th 2016. Of all the samples locations, 1 location was greater than 25 ppb Au and 9 locations were over 15 ppb Au. The data from the soil chemistry did not show any promising areas. The highest Au concentrations are spread out over the sampled region revealing no obvious areas of interest. If further exploration is to be undertaken at Barker then it may be necessary to use the Au pathfinder elements (ie. As, Sb, Pb, Mo) to narrow down potential areas to use other surficial exploration techniques such as IP resistivity or probe.

Introduction

This report documents work done on the Barker property in the 2016 field season. This property is approximately 100 km south of Dawson and is fully owned by White Gold Corp. The work done on the property consisted of XCAM aerial imagery and soil sampling.

With the help of Alpine Aviation, the XCAM was able to capture approximately 300 square km's of aerial imagery. The property was split into two missions, east and west, that were flown on October 24th.

A total of 3115 soil and representative samples were taken between September 20th and October 15th 2016. All sample analysis was done at Bureau Veritas in Vancouver and any helicopter support was provided by TNTA.

Property Description and Location

The Barker property (610000mE, 7000000mN) is approximately 100 kilometers S of Dawson City, Yukon, Canada (Figure 1). It lies south of the Stewart River; the closest corner of the property is 1km away from the Stewart. Barker can be found on NTS map 115O02.

Barker encompasses an area of tree-covered hills on the Yukon Plateau, incised by mature dendritic drainages that are part of the Yukon River watershed. Most is forested, undulating hills, with mature pine forest and thick moss on the ground. Northern slopes commonly have year-round permafrost beneath the moss.

Access to the property is mainly helicopter supported. There are placer mining roads in Barker Creek but no access to main territorial highways. Barge access is available at adjacent Thistle landing and airstrip.

Claim Information

The Barker property consists of an aggregate of 1506 claims and 12,737 hectares (Figure 2). Claims are under two different names of; Angel (678 claims) and Rev (828 claims). All claims are located with UTM Nad 83 Zone 7 (Table 1). The full list of claims can be found in Volume 2: Appendix A, an ANSI D sized map of the claims on the property can be found in Volume 3: Appendix A.
Some of the Angel claim numbers overlap with each other (Angel 219 – Angel 242). The overlapping claims are still distinguishable by their grant numbers.

History

Before 2016 Barker was a portion of the Whiskey property, specifically the Rye, Oak and Water groups of the Whiskey (Dennis Arne, 2010). The claim name changed when ownership was taken over by White Gold Corp.

Very little mineral exploration has occurred on the Whiskey Property prior to Smash Minerals 2010 field season. The work done on the Barker portion (Rye, Oak, Water) of the property in 2010 consisted of 42 rock samples and 2,326 ridge-spur soil samples (Dennis Arne, 2010).

Publicly available records from assessment reports and mineral inventory files available from the Yukon Energy, Mines and Resources at best indicate very sparse and undetailed accounts of mineral exploration from the late 1800's Klondike Gold Rush until the late 1960's when Canadian Occidental Petroleum Ltd. initiated a regional reconnaissance exploration program. In the late 1990's, moderate interest renewed in the Whiskey Property area, but very limited exploration was performed by non-governmental organizations (Dennis Arne, 2010).

In 1976, Andac Resources Ltd. conducted a 616 line-km airborne magnetometer survey over the McKinnon and Montana Creek areas to map the distribution of rock types by their magnetic response. There are no reports of follow-up exploration from this survey (Dennis Arne, 2010).

In 1999, Nordling and Rudis (2000) collected 54 grab samples from the Henderson Dome area on expired quartz mining claims CHER 1-16 and BON 1-4. These results, with the best sample assaying 2280 ppb Au, 315 ppm Zn and 2696 ppm As, led them to conclude that there is a possible low sulphidation epithermal or deeper seated intrusive gold deposit based on the minerals found, the bleached/altered nature of the rocks and the widespread presence of barite within or adjacent to the areas covered by the claim groups.

No historic hard rock mining has occurred on the Whiskey Property. However, the area has seen substantial placer mining operations from the 1800's Klondike gold rush to present day. The Whiskey Property falls within the Lower Stewart Placer Mining District where placer gold is primarily produced from Black Hills, Henderson, Barker and Scroggie Creek and their many smaller tributaries (Dennis Arne, 2010).

Geology

The Barker property is situated within the Yukon-Tanana Terrane (YTT), which spans part of the Yukon Territory and east-central Alaska. This terrane is part of the intermontane superterrane, and is bounded to the northeast by the right-lateral Tintina-Kaltag fault system and to the southwest by the Denali-Farewell fault system (Lucy Hollis, 2011).
Metallogenesis in the YTT is strongly governed by tectonics from the accretionary period of the Canadian Cordillera. Metallic mineral deposits preserved within the northern Cordillera range in age from 1.6 billion to less than 20 million years ago (J.L. Nelson M. C., 2007). The northern Cordillera is a highly fertile metallogenic environment that hosts world-class ore bodies (Lucy Hollis, 2011).

Regional Geology

Between late Paleozoic and early Cenozoic, the Canadian Cordillera was accreted to the western margin of the North American craton. Many of the accreted terranes comprise island-arc and oceanic juvenile rocks, but terranes of older pericratonic affinity exist (M. Colpron J. N., 2006). The largest of these accreted pericratonic terranes is the YTT. In the mid-Paleozoic, the YTT rifted southward and westward away from the north-west margin of Laurentia, in conjunction with the opening of the Slide Mountain Ocean (J.L. Nelson M. C.-B., 2006) (R.G Berman, 2007) (M. Colpron J. N., 2006). Quartz-rich schists and gneisses are the result of continental margin-type deposition of sediments during this period. Reversal of subduction and closure of the Slide Mountain Ocean began in the mid-Permian, with re-suturing of the YTT occurring near its point of origin in the early Mesozoic (Maurice Colpron, 2007). Closure of the Slide Mountain Ocean resulted in kilometre-scale thrust stacking of the YTT, resulting in imbrication of slices of the mafic and ultramafic rocks of the Slide Mountain Terrane amongst the YTT (Lucy Hollis, 2011).

Regional compression gave way to extension in the Cretaceous and continued through to the Eocene with the initiation of the Tintina fault as a major transcurrent structure. Extension related magmatism was responsible for mid-Cretaceous intrusive rocks (Lucy Hollis, 2011).

The Klondike schist, which is North of Stewart River, is composed of highly fissile muscovite/chlorite-quartz schists with primarily volcanic protoliths (Mortensen, 1992) (R.G Berman, 2007).

Basement rocks were metamorphosed by several events, with peak metamorphism during the late Permian. Jurassic-age thrusting created km-scale stacked thrust sheets, which are marked along their strike by thin (m-scale) lenses of commonly magnetic ultramafic rocks (serpentinite) (D.J. MacKenzie, 2008). This thrusting event was followed by subsequent late Cretaceous extensional deformation associated with normal faulting. Younger intrusive rocks include Jurassic and mid Cretaceous-age granodiorite, and volcanic rocks of the late Cretaceous Carmacks Group comprising dacites, andesite, basalt and minor rhyolites (J.J. Ryan S. G., 2003).

Property Geology

In the property geology map (Figure 3), in the Stewart River area is a middle Palaeozoic meta-siliciclastic rock unit that correlates to the Snowcap assemblage elsewhere in the YTT (M. Colpron J. N., 2006) (R.G Berman, 2007). The Snowcap assemblage is interpreted as a metamorphosed continental margin comprising meta-sedimentary quartzites, psammites, pelitic calc-silicic schists and marble, along with amphibolites and minor ultramafic rocks (J.J. Ryan S. G., 2001).

Stratigraphically above the siliciclastic rocks is a unit of intermediate to mafic metavolcanic rocks including amphibolite gneiss and orthogneiss, which likely represents a continental arc system. It has been suggested that the mafic orthogneiss and feldspar augen gneiss may comprise a sub-volcanic intrusive complex of late Devonian to Mississippian granite, tonalite, diorite, monzogranite, and granodiorite intrusive rock (J.J. Ryan S. G., 2001) (R.G Berman, 2007). Other rock types include carbonaceous pelite, chert and minor quartzite of the Devonian to Mississippian Nasina assemblage (M. Colpron J. N., 2006). A full-size map and of the property geology and geological unit legend is in Volume 3, Appendix B and F respectively.

2016 Exploration Program and Results

Soil Sampling

Method and Approach

Soil surveys are typically conducted by crews of 5 samplers, one of which is the Crew Boss who oversees the survey. The Crew Boss is responsible for coordinating safe and efficient operation of survey and ensuring survey is conducted as planned. All samplers run solo traverses proximal to each other so that radio contact with other crew members can be maintained.

Field technicians navigated to sample sites using handheld GPS units. A C-Horizon sample is collected using an Eijklcamp brand hand auger at a depth of between 20cm and 110cm. Where necessary, in rocky or frozen ground, a mattock is used to obtain the sample. Photos are taken of the sample site 5m from sample hole with auger inserted. Typically, 400 to 500 g of soil is placed in a pre-labeled bag. An aluminum metal tag inscribed with the sample identification number is attached to a rock or branch in a visible area at the sample site along with a length of pink flagging tape. A field duplicate sample is taken once for every 25 samples. The GPS location of the sample site is recorded with a Garmin 60cx or 76cx GPS device in UTM NAD 83 format, and the waypoint is labeled with the project name and the sample identification number. A weather-proof handheld device equipped with a barcode scanner is used in the field to record the descriptive attributes of the sample collected, including sample identification number, soil colour, soil horizon, slope, sample depth, ground and tree vegetation and sample quality and any other relevant information.

Sample Preparation and Analysis

Once received in the lab, soil samples are prepared using the SS80 method. Samples are dried at 60 degrees Celsius and sieved such that up to 100 grams of material passes 180 microns (80 mesh). The samples are then analyzed by the AQ201+U method which involves dissolving 15 grams of material in a hot Aqua Regia solution and determining the concentration of 37 elements of the resulting analyte by the ICP-MS technique.

Analytical certificates and sample descriptions are compiled in Volume 2, Appendix B and C respectively.

Results

There were 3115 total soil and representative rock samples that were taken from the Barker property in 2016. Samples that have the same UTM coordinates are soil and representative samples that are taken from the same location, there are 608 of these. Full maps showing North, Central and South Barker sample locations are in Volume 3: Appendix C, D and E respectively.

Of all the samples locations: *1 location was greater than 25 ppb Au and 9 were over 15 ppb Au.* The Au in soil map is located in Figure 3 or Volume 3: Appendix B on the property geology map.

XCam Aerial Imaging

Methods and Approach

The XCam consists of two Canon cameras inside a pod that is attached to the wing struts of a small plane so that the pod is parallel to the ground. Mission parameters (ie. target area, elevation, flight lines) are chosen before the flight and cannot be changed during the mission. The plane flies its specified lines so that the cameras can capture images of the desired target on the ground. The Barker property had to be flown in two separate missions (east and west) because of the size. More detailed explanations of the setup can be found in the XCam report in Volume 4: Appendix A.

Results

Results of the Barker property aerial imagery can be seen below in Figure 4. The total area covered by the two missions flown approximates to 300 square kilometers.

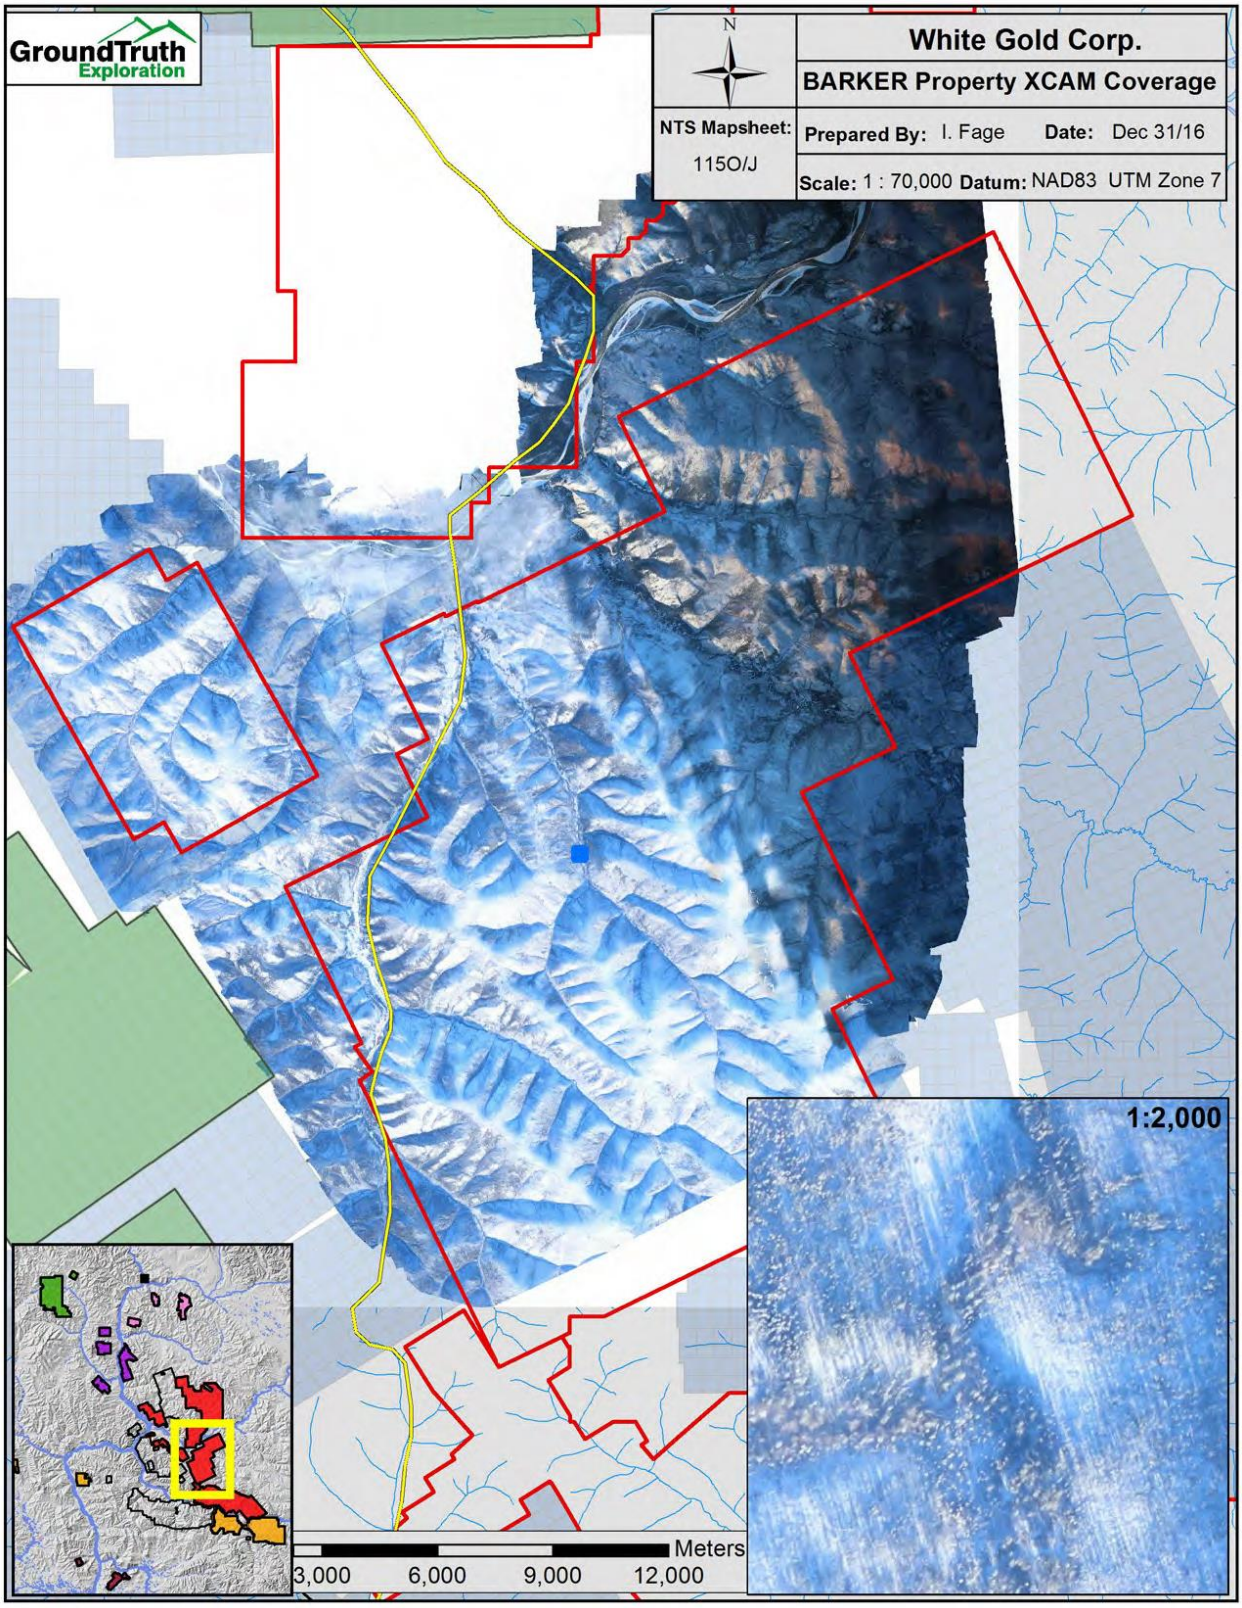

Figure 4: XCam Aerial Imagery Over the Barker Property

Interpretation and Recommendations

The data from the soil chemistry did not show any promising areas. The highest Au concentrations are spread out over the sampled areas revealing no obvious areas of interest. The concentration of Au even in the highest valued samples was just above 25 ppb which is not of high interest. If further exploration is to be undertaken at Barker then it may be necessary to use the Au pathfinder elements (ie. As, Sb, Pb, Mo) to narrow down potential areas to use IP resistivity or probe.

The 300 km^2 of aerial imagery from the XCam has provided a useful tool for future exploration and exploration planning on the Barker property.

SUBJECT	2016 Fall XCam Summary

This is the summary of activities for the XCam during the month of October 2016. From October 13 to October 25 aerial surveys were conducted with the XCam. Inbetween weather days, 40 hours of flight time was accumulated in 7 days of flying. 10 properties were surveyed:

- Black Hills
- Pedlar
- Brew
- Barker
- Indian River
- Loonie
- Toonie
- Dime
- Hunker
- Bonanza

Timeline of Events

On the afternoon of October 13 the XCam (Model: XCam B) of WaldoAir was picked up from AirNorth Cargo in Whitehorse. Aerial surveys are conducted with the XCam attached to an airplane, for this season a Maule (ie. an airplane) from Alpine Aviation (Figure 1). A test flight was scheduled for that evening; the test was successful, the camera took photos and georeferenced them without complications. Another test flight was completed the next morning before leaving Whitehorse for Dawson City. A survey of the Black Hills claim was conducted enroute to Dawson City but technical difficulties resulted in only a partial survey conducted at the north eastern most section of the Black Hills claim.

Over the next two days (Oct 15 and Oct 16) more of the Black Hills was surveyed working east to west, north to south. The daily schedule consisted of leaving at first light, fly for half a day, land at a nearby airstrip to refuel and break, and then fly for the rest of the day landing back at Dawson Airport. The weather stayed accommodating until October 17. See table 1 for the flight schedule.

After the weather cleared, on Oct 20 another attempt was made to survey a section of the Pedlar claim. The following morning another storm system moved in halting operations until Oct 23. When the weather cleared up, missions resumed with the Black Hills claims working south to the Pedlar claims. On Oct 24 Pedlar and Barker were completed, connected the entire area. On Oct 25, the remaining claims were surveyed.

Equipment

The XCam pod is a plastic pod containing two cameras set to capture a panoramic shot. The pod is mounted onto bar attached a strut on the plane (figure 2). The bar is parallel to the wing, which will be parallel to ground in flight, but angled slightly upwards on the ground since the plane is a tail-dragger. The pod is attached with two ring to a curved metal plate on the bar.

Inside the pod are two Canon cameras and a single usb hub. The cameras are both connected to the hub which is connected to a microcontroller to the rear ports (figure 3). These ports connect cables (usb and coaxial) to the external GPS unit mounted to the top of the wing, the external

batter, and the tablet: the latter two situated inside the plane. The GPS is connected to the microcontroller first to provide location data for the photo metadata.

Inside the plane is the tablet, two external camera batteries, and in inverter (figure 4). The pod does not have an internal power source and can not run off power from the plane, instead custom batteries are used. The tablet itself also runs out of power fast during a survey. It is charged with the plane through an inverter.

On the tablet will be software to create and view missions live as they are being surveyed. It has software to utilize the external GPS and provide heading corrections to ensure correct coverage and overlap of photos. It is also possible to view the camera image live via the tablet and Canon software.

All the mission parameters (ie. target area, elevation, flight lines) are chosen with mission creation and can not be changed during a mission. The only settings that can be altered without creating a new mission are camera settings (ie. shutter speed, f-stop, and ISO).

Notable configurations for the Yukon.

Due to the high latitude of the Yukon, there is a much lower sun angle: and exacerbated during fall and winter. Thus higher light settings than normal are recommended. The typical settings are shutter speed of 1/4000, ISO1600, and fStop 4.5. In even darker conditions the fStop can be lowered to 4.0 and the shutter increased to 1/2000. Alternatively, in high snow glare, the shutter and ISO can be lowered to 1/8000 and 800 alternatively.

Missions

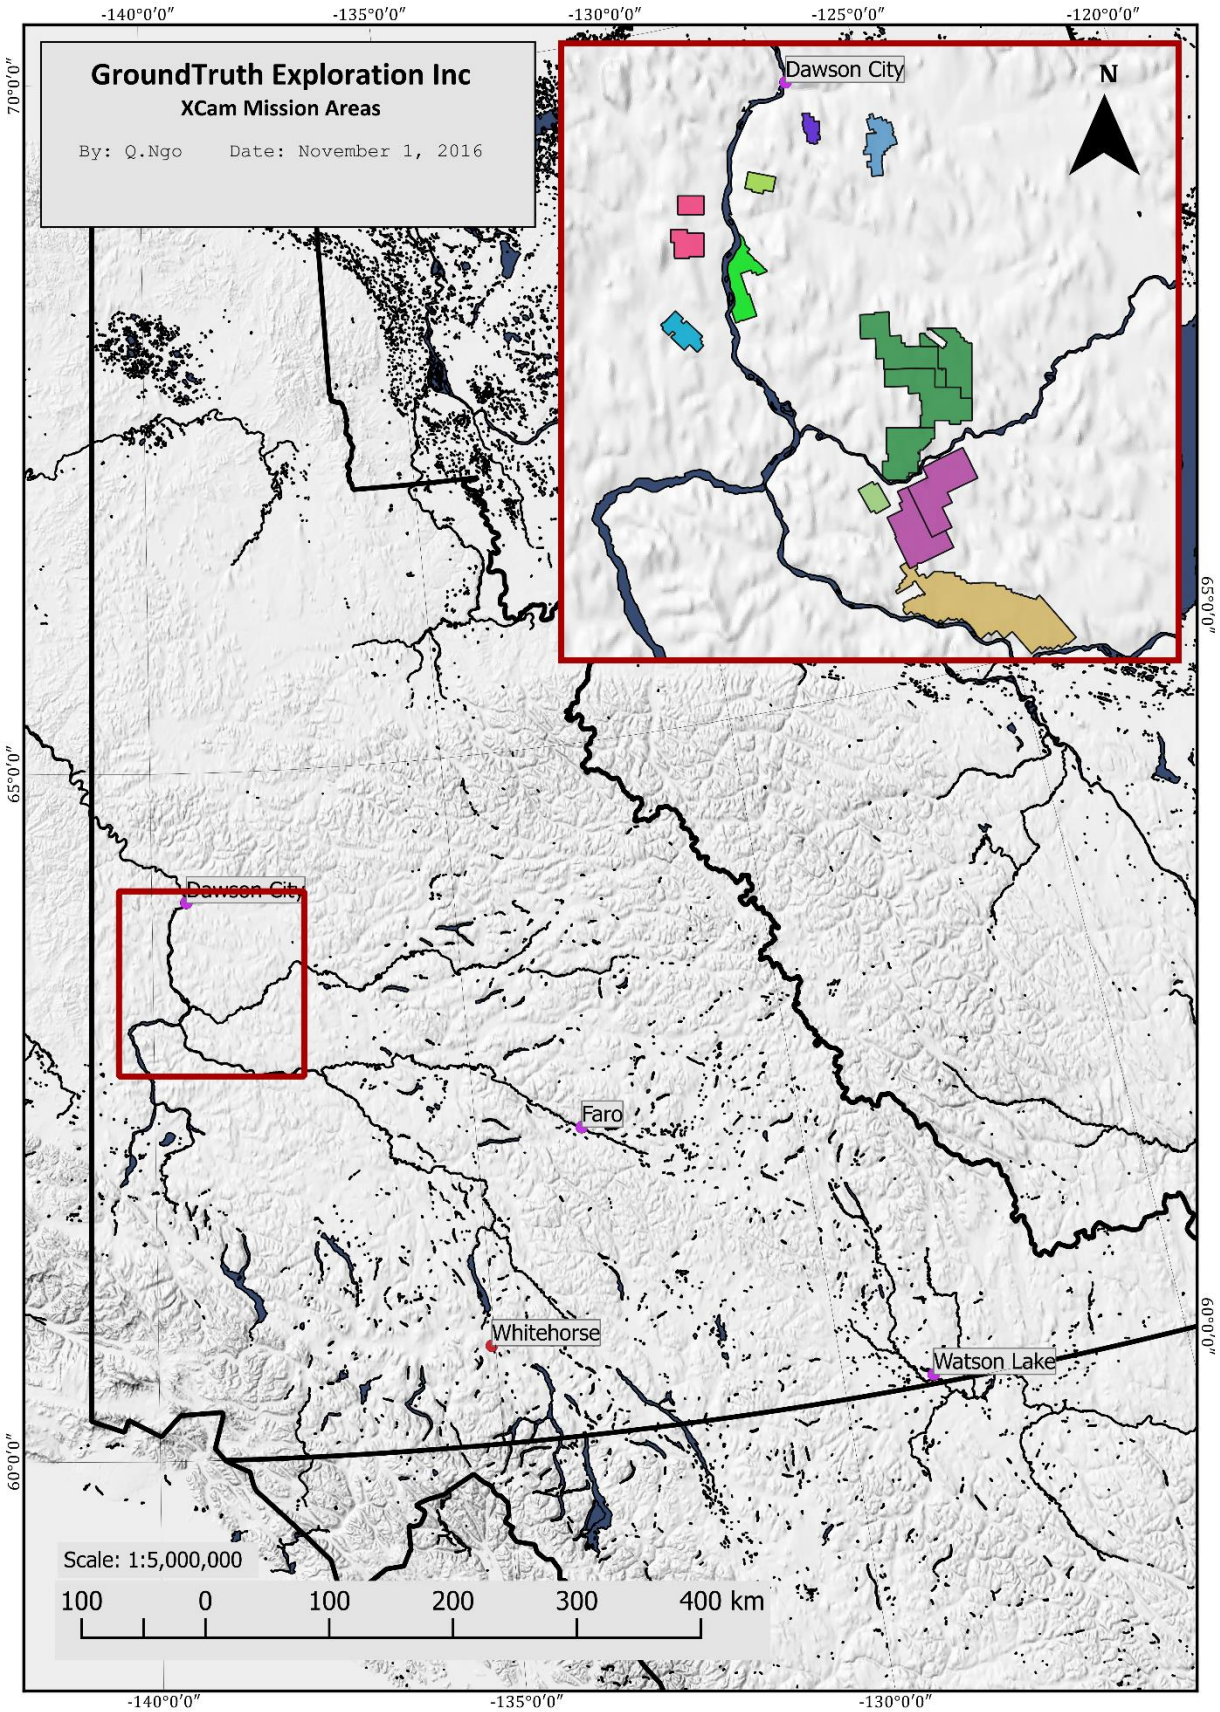

In total 18 missions of varying coverage was completed (Map 1). The large claim blocks (ie. Black Hills, Pedlar, Barker) were split into multiple missions to make them more manageable. One survey covered two claims, the Brew+Barker (West) and only because Brew was both small enough and adjacent to Barker that made it easier to fly it together. See table 2.

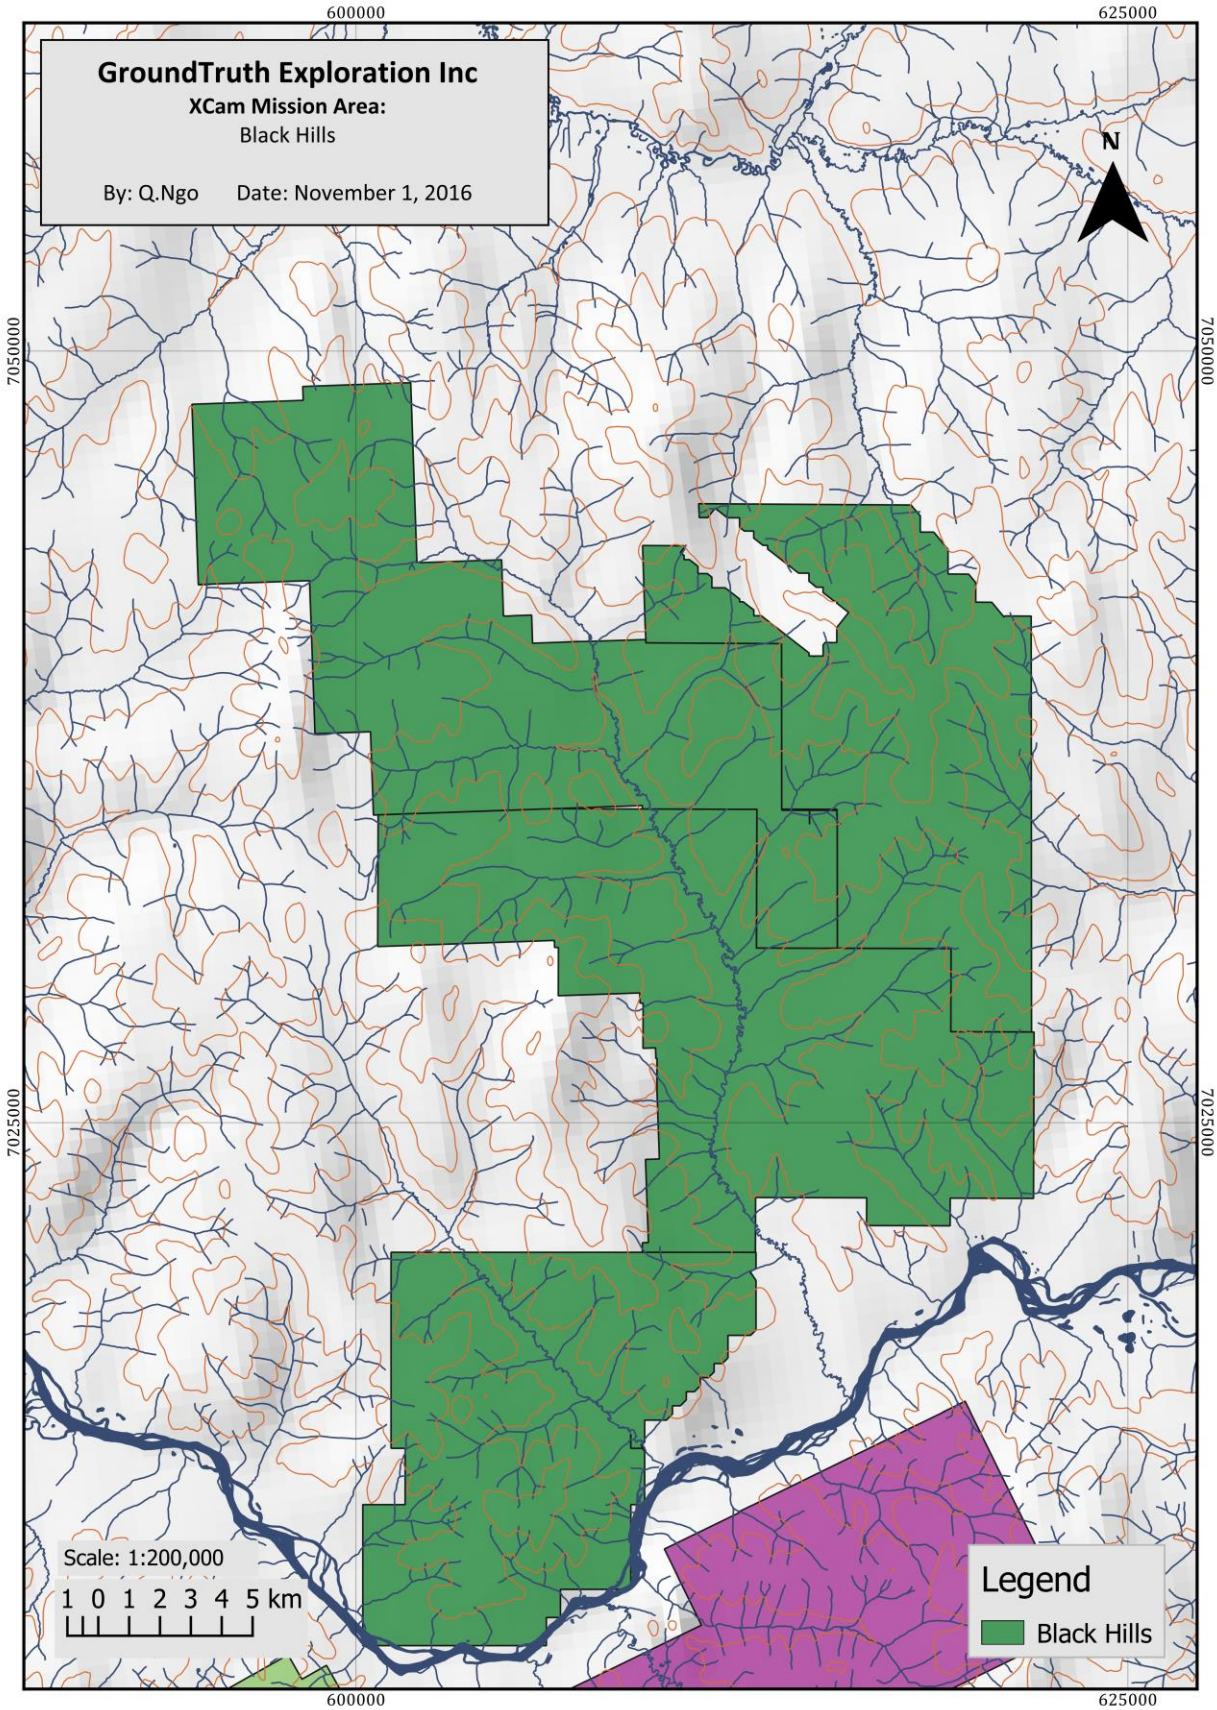

Black Hills (Map 2) was flown on four separate days. The process took longer than other claims not because it was a large property, but because all of it was flown as higher resolution. Higher resolutions are flown at lower altitudes and to cover the same area there must be more flight lines. Black Hills is also the only survey done pre-snow.

Pedlar (Map 3) was flown on two days, with a small western section flown on a third. Pedlar was the first survey that dealt with snow glare (figure 5). All other flights there-after also had snow. It was also split into five missions. There was scattered cloud layers during the survey, in addition to the river fog, reducing the light.

Figure 5. XCam mission in cloudy weather over snowy terrain.

Brew (Map 2) is the smallest claim block. It was flown in conjunction with Barker for ease of planning. The weather consisted of scattered cloud layers.

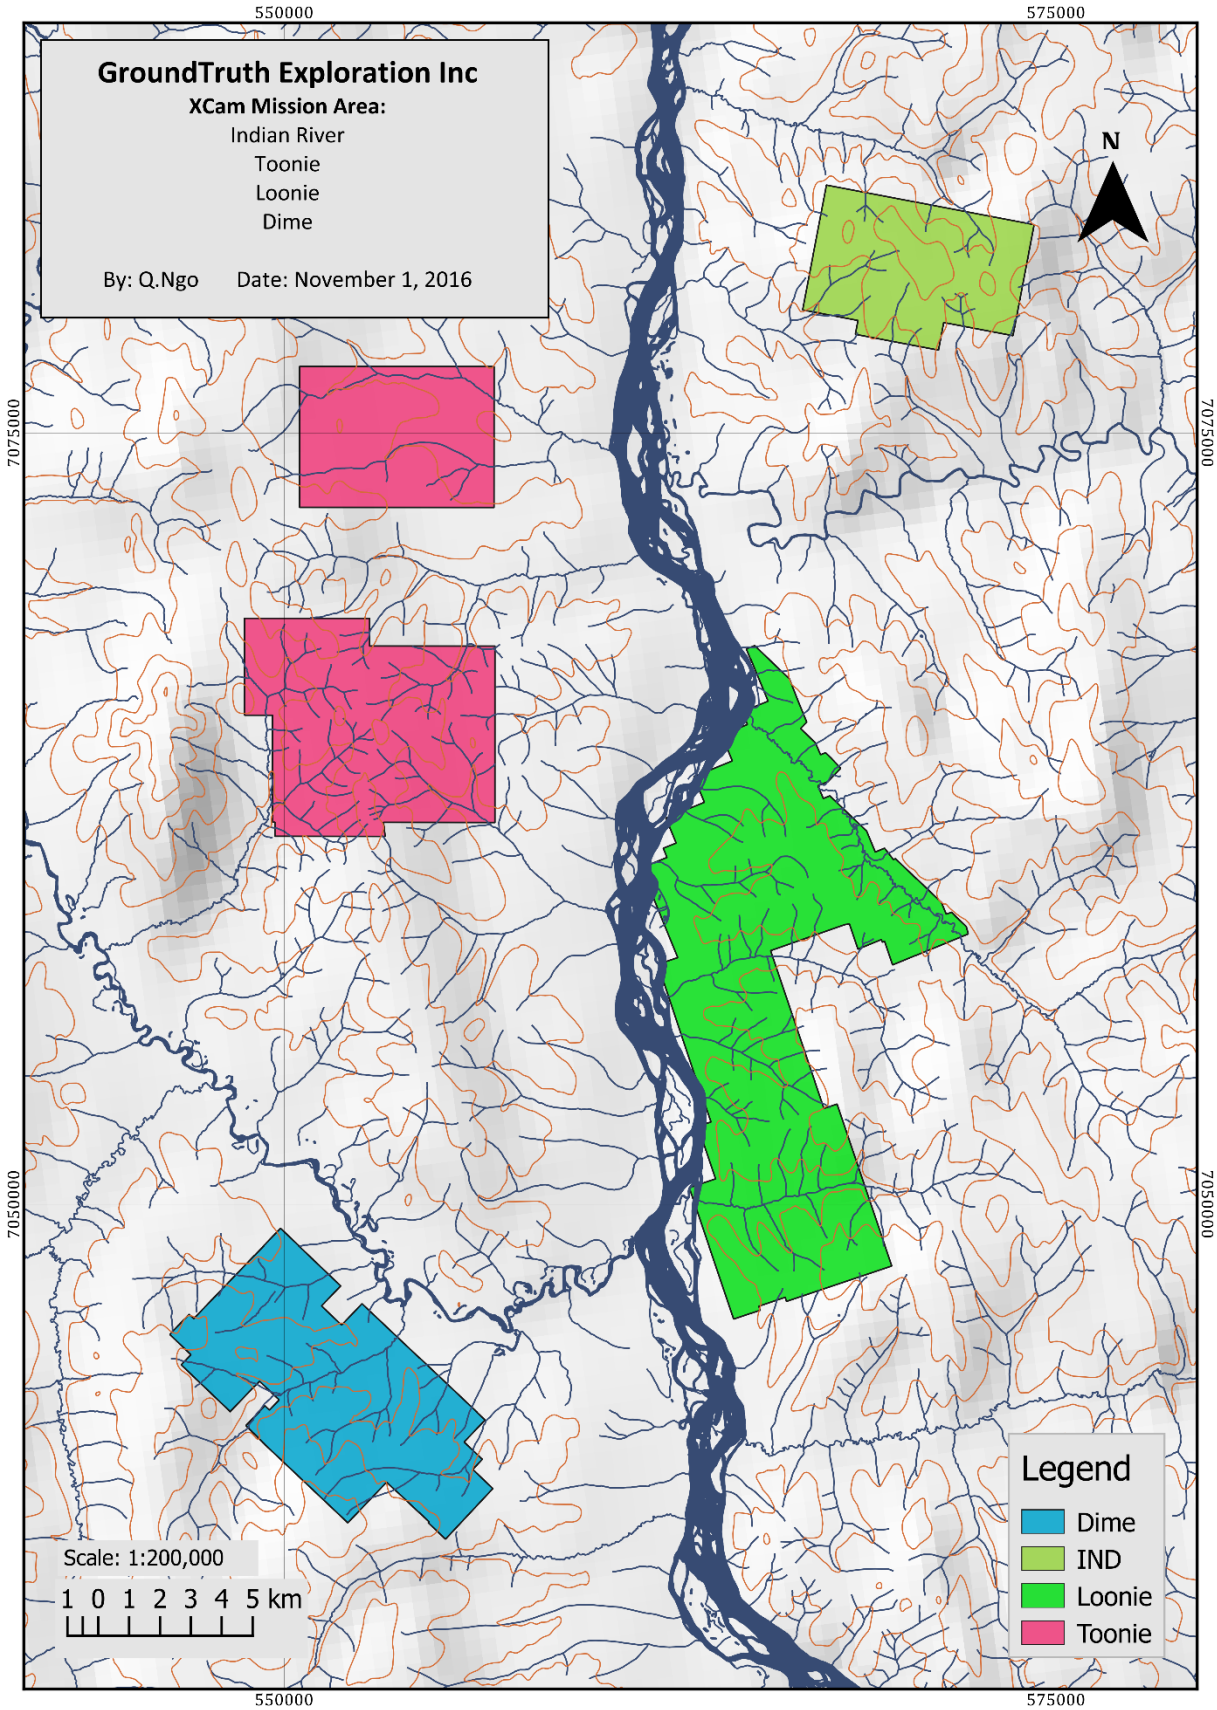

Barker (Map 3) is a moderate sized claim block between Pedlar and Black Hills. Big enough to be split into two missions. These missions also covered the Stewart River to maintain continuity of imaging from the northern limit of Black Hills to the Yukon River. It took one whole day to complete.

Indian River (Map 4) was the first of six missions flown that day. The first four mission were flown without break, leaving from Dawson Airport in the morning. The weather was slightly above freezing with scattered cloud layers.

Toonie (Map 4) was the second mission, completed before Loonie which is closer to Indian River for optimal weather reasons. Only the southern block was imaged.

Dime (Map 4) was the third mission of the day.

Loonie (Map 4) was left last in this sequence due to the fog generated in the morning by the Yukon River. After the plane attempted to survey Sixty Mile river but the weather was not permitting.

Hunker (Map 5) was the first mission after determining that Sixty Mile could not be surveyed. It took approximately an hour to complete, including travel to and from the airport. The weather was clear.

Bonanza (Map 5) was the last mission of the day. It took approximately 45 minute to complete, including travel to and from the airport.

Conclusion

In conclusion, 44 hours of flying was conducted to survey 3300 square kilometers at greater than 30cm resolution. With weather permitting, and good light conditions, the XCam is a powerful tool for aerial imaging.
