Introduction

White Gold Corporation contracted GroundTruth Exploration Inc. to conduct a 1,896 soil sample program on the Hayes property June 9, 13 –18, 2017. This is an early stage gold (Au) exploration target so the focus of the work was to find new target anomalies for future exploration, and to expandi existing targets in preparation for more detailed geophysical study and drill testing.

The program consisted of three stages of soil based exploration:

1. 20 first pass recce traverses spread through-out the property to test more ridges, spurs and geological targets for possible mineralization.
2. Three Grids around anomalous gold values identified in previous soil sample reconnaissance (recce) lines. Each grid is 900m x 1500m.
3. The expansion of two previous grids that contained anomalous gold-in-soil trends open on their borders.

The cost of the 2017 program was $161,998.01

Property Description and Location

The Hayes property is 264 square kilometers, consisting of 1316 individual claims

The Hayes property is located in the Dawson Range area of the west-central Yukon on NTS Map sheets 115J/9, 12 & 115I/13, 16. This is approximately 115 km south of Dawson City, YT (Figure 1). The claims are centered at NAD 83 zone 7N - 636175 mE / 6961760 mN; immediately south of the Yukon River. The property is adjacent to White Gold Corps Betty Property to the west, it is 35 km East of Kaminak Gold Corporation's Coffee property.

The 2017 program was supported from Dawson City. The soil samplers were camped closer to the property on the Scroggie airstrip, and the project was accessed from there by helicopter. Access can also be provided via barge landings along the Yukon River at Isaac and Britannia Creeks, and via fixed wing aircraft on the Casino, Rude Creek, or Hayes Creek airstrips.

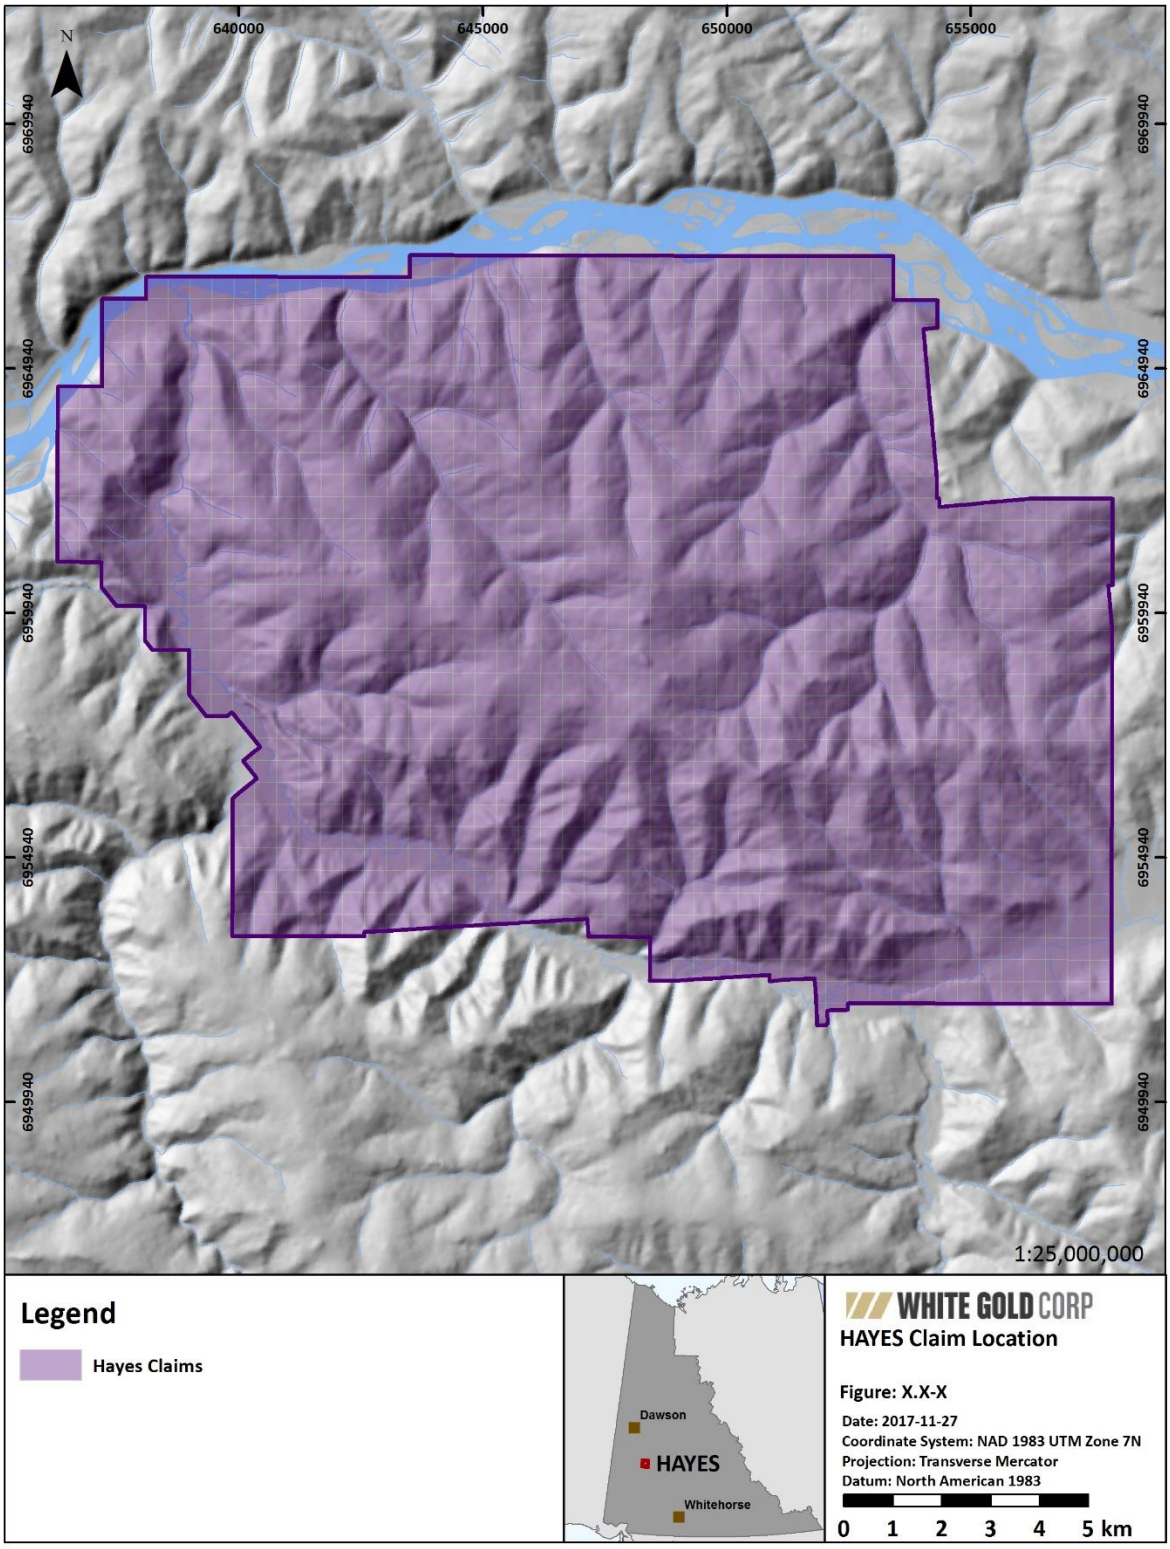

Figure 1: Property Location

Claim Information

The property consists of 1,316 Quartz claims covering 26,350 hectares of ground (Figure 5). All the claims are held 100% by White Gold Corp. (Table 1). See Appendix B for complete claim listing and maps.

Table 1: Claim Details

Claims	Grant Numbers	Registered Owner/Operator
HAYES 1-100	YE24001-YE24100	White Gold Corporation 100%
HAYES 101-1316	YE22701-YE23916	White Gold Corporation 100%

History

The entire claim block was staked by Wildwood Exploration in 2011. It was optioned to Ethos Capital Corp in 2011. Ethos completed 3450 ridge and spur, primary stage exploratory soil samples on the property, and dropped the property in 2012.

It was then optioned to Centerra Gold for the 2014 season. They collected an additional 2175 soil samples on the Hayes Block. The majority of these were ridge and spur reconnaissance soil lines on the northern portion of the block in addition to 5 'mini' 250 m x 250 m soil grids over Au anomalies defined by previous reconnaissance sampling on the southern portion of the Hayes Block. All the grids had samples with anomalous gold with samples ranging from trace to 104.5 ppb Au; however, only two had consistent results. The ridge and spur sampling defined a few one-hit anomalies in the northeastern corner of the Hayes block of 197.8 ppb Au, 251.4 ppb Au, and 129.9 ppb Au. None of the soil anomalies from the grids or ridge and spur lines have been followed up on. Centerra dropped the claims in December of 2014. Historic soil samples are shown in figure 6.

White Gold Corp purchased the claims in 2016. Their work forms the basis of the report.

Geology

Regional Geology

The project is located within the Yukon-Tanana terrane (YT) of the western Yukon and central Alaska. The YT is an accreted terrane of polymetamorphosed and polydeformed metasedimentary, metavolcanic, and metaplutonic rocks of Upper Paleozoic and older ages bound by the Tintina fault to the northeast and Denali fault to the south-west. Overall, it records a prolonged and complex history of tectonic and magmatic processes along the northwestern margin of Laurentia between middle Paleozoic and Early Tertiary time. It has an equally complex metallogenic evolution with at least 10 pulses of mineralization of various styles currently recognized (Nelson et al 2013, Allan et al 2013, Mortensen and Allan 2012).

In the area of the Hayes property bedrock consists of meta-sedimentary, meta-volcanic rocks of the Devonian-Mississippian Nasina assemblage and Simpson Range suite that are cross-cut/overlain by the Permian Snowcap and Klondike assemblages. These units underwent ductile (D1/D2) deformation associated with amphibolite facies metamorphism during the Late Permian Klondike orogeny. This event was associated with the accretion of the YT to Laurentia and associated closure of the Slide Mt Ocean and obduction of ophiolitic slices of the Slide Mt terrane.

The area underwent additional compression and ductile deformation (D3) associated with greenschist facies metamorphism during the Late Triassic-Early Jurassic. The event was associated with widespread thrust faulting and imbrication of the Slide Mt. terrane, and the emplacement of felsic to ultramafic intrusions. This transitioned into a period of regional uplift and exhumation and is associated with dominantly east-west oriented sinistral faults, localized north-northwest vergent folds, and high angle reverse faults (D4). This period of deformation spans the ductile to brittle transition and are associated, particularly the E-W sinistral faults, with 'orogenic' style gold mineralization throughout the White Gold district and Klondike.

Renewed northeast dipping subduction under the continental margin during the Late Cretaceous led to renewed magmatism across the YT, and is associated with felsic to intermediate intrusions of the Dawson Range batholith and felsic-mafic volcanic rocks of the Mount Nansen suite. The Early Cretaceous arc activity ceased around 99Ma; at which point it stepped farther inboard and is associated with intrusive suites in the Selwyn Basin (ie. Tombstone suite, etc.). This lull in magmatism was associated with the formation of the Indian River Formation, a coarse clastic sedimentary package deposited in an alluvial/fluvial to shallow marine setting that records approximately 40 million years of sedimentation following the formation of the Dawson Range Arc.

Arc style magmatic and volcanic activity renewed during the Late Cretaceous and is associated with a series of calc-alkaline plutons and high level porphyry dikes, plugs, and breccias in the Casino and Freegold areas, and age equivalent intrusions in eastern Alaska (79 – 72Ma). This event was also likely associated with the initiation of dextral offset along the Big Creek fault and reactivation of older Jurassic age structures in Dawson Range area. It is also associated with variable styles of mineralization ranging from Cu-Au-Mo porphyries (Casino), intrusion-related/epithermal occurrences (Sonora Gulch, Freegold area), and structurally controlled gold / 'orogenic' mineralization (Coffee, Boulevard, Moosehorn). At 72Ma there was a distinct change

in magmatism with widespread bi-modal volcanism (Carmacks group) and the emplacement of small, high-level, felsic plugs and stocks (Prospector Mountain suite) throughout the YT. A prominent set of northeast trending normal and sinistrally oblique faults are commonly associated with the intrusive and volcanic rocks of this event and are broadly coeval with magmatism.

A final magmatic event occurred during the Late Tertiary and is associated with the emplacement of bi-modal suite of predominately north-south trending dike swarms, plugs, and local pyroclastic rocks. Gabrielse et al 2006 suggests that the magmatic event was likely coeval with the early stages of dextral offset along the Tintina fault. (Gibson, 2014)

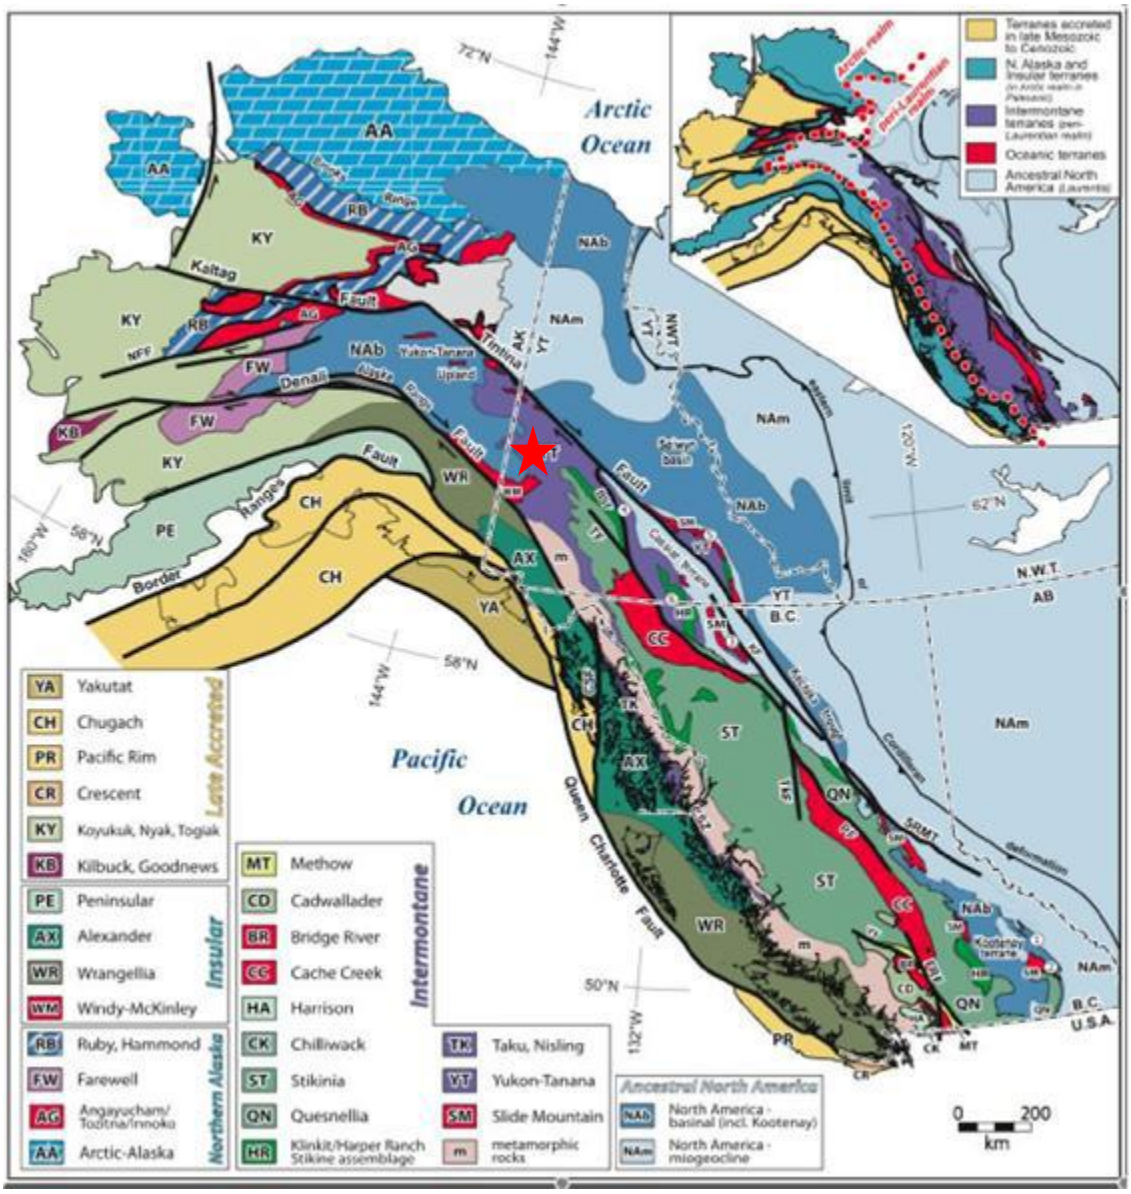

Figure 2: Terrane map of the northern Cordillera (modified from Nelson et al 2013). The red star is the approximate location of the Hayes property.

Property Geology

The most recent geologic mapping in the area was performed by Ryan et al (2013) as part of the Stevenson Ridge mapping area (GSC Map 116). In general, the area can be divided into three lithologic domains. The oldest, consists of metasedimentary units of the Snowcap assemblage along the southern portion of the property. These are thrust over meta-intrusive and meta-volcanic units of the Simpson Range suite along the Yukon River Thrust. These units are cut by Cretaceous granodiorite intrusives of the Dawson Range suite to the southwest. Additionally, small hypabyssal plugs of Prospector Mountain suite(?) intrusives occur within the northern half of the block. Small bodies of ultramafic bodies are also noted along thrust faults; particularly in the Hayes Creek and Sonora Gulch areas to the south.

Structurally, the area is dominated by the east-west trending Yukon Thrust and the dextral Big Creek fault (figure 3). Numerous other east-west and northeast trending structures are inferred in the area based on magnetic and radiometric imagery of the block (Figure 4).

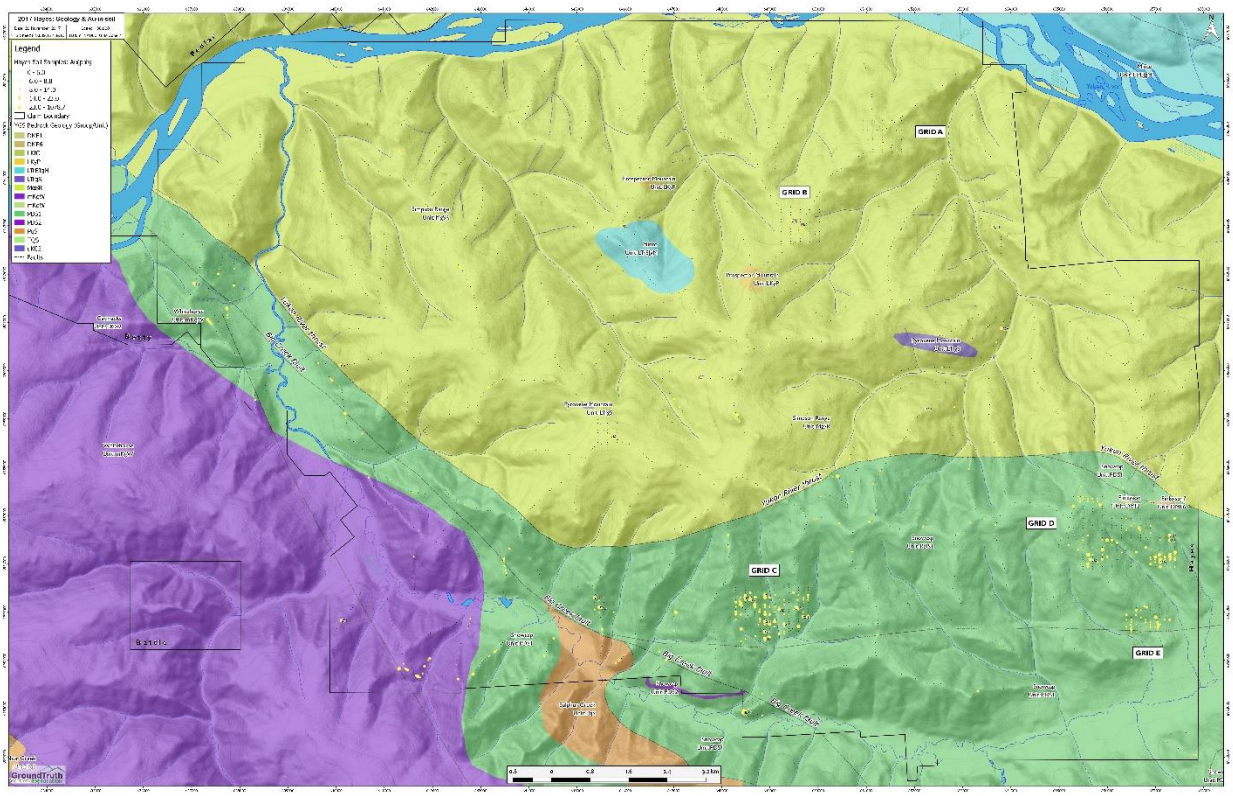

Figure 3: Geological map of Hayes Block

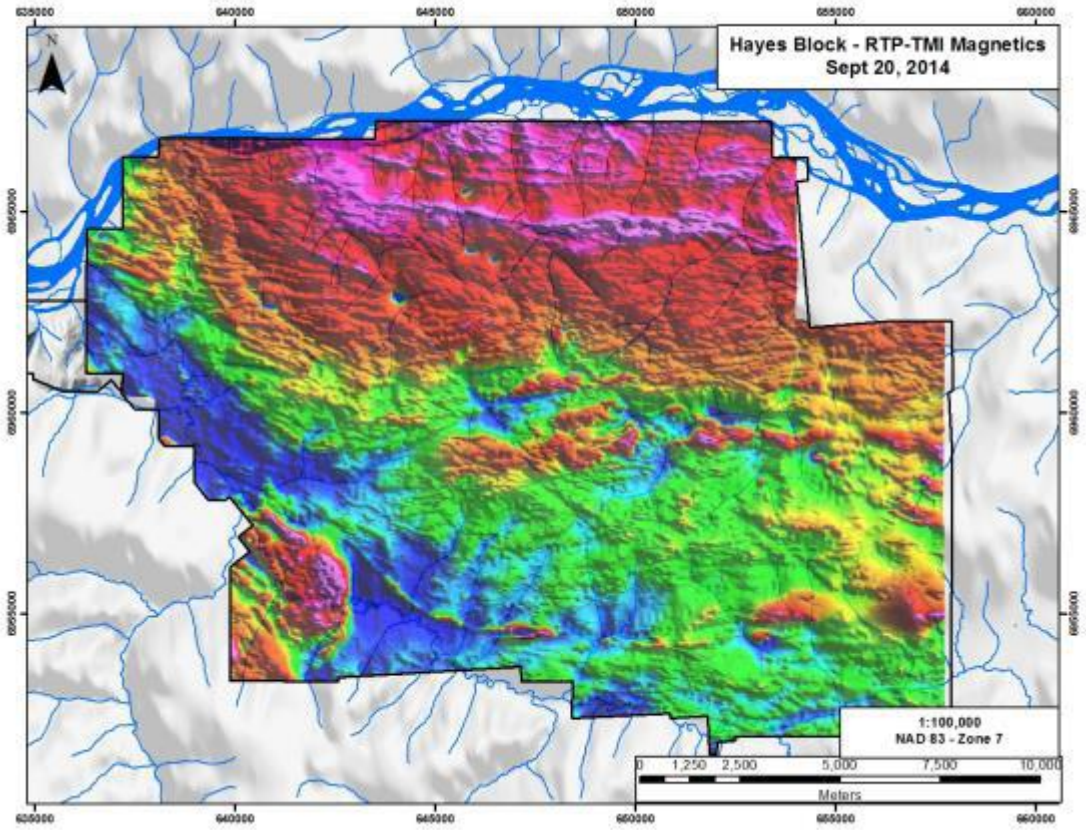

Figure 4: Reduced to pole, total magnetic intensity map of the Hayes Block

2017 Exploration Program and Results

Geochemical Survey: Soil Sampling

The 2017 exploration program consisted of a 1,896 soil sample program on June 9, 13 –18, 2017. The program consisted of three stages of soil based exploration:

1. 20 first pass recce traverses spread through-out the property to test more ridges, spurs and geological targets for possible mineralization.
2. Three Grids around anomalous gold values identified in previous soil sample recce lines. Each grid is 900 m x 1500 m.
3. The expansion of two previous grids that contained anomalous gold-in-soil trends open on their borders.

Only 2 of the new recce lines resulted in gold values above 25 ppb. The two new grids in the Simpson Range Assemblage show limited to no expansion on the original targets identified in the recce traverses, while the new and expanded grids in the Snowcap Assemblage all show significant east-west trending gold-in-soil anomalies that remain open along strike.

Method and Approach

Soil surveys are typically conducted by crews of 5 samplers, one of which is the crew boss who oversees the survey. The Crew Boss is responsible for coordinating safe and efficient operation of survey and ensuring survey is conducted as planned. All samplers run solo traverses proximal to each other so that radio contact with other crew members can be maintained.

The following equipment is used for the completion of the survey:

Soil Auger/Mattock:	Eijklcamp hand auger and 5lb mattock
Handheld Datalogger:	Samsung S5: weatherproof handheld with barcode scanner
Camera:	Samsung S5: 16 megapixel camera
GPS units:	Garmin 76cx handheld GPS
Radios:	VHF Radio for helicopter communication
Processing:	Laptop computer
Software	Fulcrum App forms and database, Ozi Explorer for waypoint upload, QGIS Mapping Software.

Survey Procedure

The survey is completed in the field according to the following procedure:

All sampling traverses are pre-planned, with pre -specified sampling intervals, typically 50 m for grid spacing and 100 m for ridge and spur recce traverses. Field technicians navigate to the sample site using handheld GPS units. The soil sampler arrives at each sample site, identifies the most appropriate location to collect the sample and lays out a sheet of plastic (12”x20” ore bag). The soil sample is taken using an Eijklcamp brand hand auger at a depth of between 20 cm and

110 cm. Samplers strive to consistently collect C-Horizon sample material. Where necessary (rocky or frozen ground) a prospector's pick ('mattock') is used to obtain the sample.

The soil is laid out on the sheet of plastic in the order it was recovered from the sample hole. Two Standardized photos are taken at each sample site- 1) Sample Location photo: across slope, 5m from sample hole with auger inserted and 2) Sample Profile photo: Close up of sample laid out on ore bag with barcode tag and Munsell color chart in photo.

The sampler places the necessary amount of soil (400-500 grams) from the bottom of the hole into a Kraft sample bag. The bag is labeled with the 3-letter project code. Three identical 7 Digit barcode ID tags are used to identify the sample: One is placed inside the bag, one is tied to the outside of the bag, and one is attached to a rock or branch in a visible area at the sample site along with a length of pink flagging tape.

A field duplicate sample is taken once for every 25 samples. Both samples are given a unique sample identification number. The data for both samples is recorded and a note is made indicating the duplicate and its corresponding sample identification number. At the client's discretion, standard reference material is inserted into the sample stream at an interval of 1:50.

The GPS location of the sample site is recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD 83 format, and the waypoint is labeled with the project name and the sample identification number. A weather-proof handheld device equipped with a barcode scanner is used in the field to record the descriptive attributes of the sample collected. These include: sample identification number (scanned into device at sample site), soil colour, soil horizon, slope, sample depth, ground and tree vegetation and sample quality and any other relevant information. As well, the GPS coordinates are entered into the handheld device as a secondary backup in case of GPS failure.

Data Processing

Each night in the field, the GPS, Handheld devices and cameras are downloaded to a laptop computer. The data is verified and mapped on a sampler-by-sampler basis in proprietary database auditing and mapping software by the crew boss. Photos are downloaded and reviewed by the supervisor to ensure quality samples are being collected and correct procedures are being followed.

In camp at the end of each day, the crew boss inspects all samples from each sampler for size and consistency as a quality check. Each sampler then repackages all samples for shipping-barcode scanning them as they are placed into a rice bag which is sealed with a barcoded security zip tie. Samples are shipped from the field to the lab on a daily basis when possible, and are tracked by the unique ID on each security seal.

The database is synchronized to the cloud hosted database each night, and photos are stored in the field to be uploaded upon return to the company's central server in Dawson City. In camps that do not have internet, a backup of the sample data is made, copied onto a USB memory stick and kept in a separate location from the laptop computer until job completion

Description of Assay Methods

The samples were prepared in Bureau Veritas facility in Whitehorse using the SS80 method. Samples are dried at 60 degrees Celsius and sieved such that up to 100 grams of material passes 180 microns (80 mesh). The prepared material was then shipped to Vancouver and analyzed by the AQ201+U method which involves dissolving 15 grams of material in a hot Aqua Regia solution and determining the concentration of 37 elements of the resulting analyte by the ICP-MS technique.

Soil sample descriptions are included digitally, while analytical Certificates are compiled in Appendix C.

Results

The results will be broken into two categories: Recce Traverses and Grids. The grids have been labelled Grid A to E in no hierarchal order, for identification during discussion within this report only. (figures 3 & 7)

Gold was compared with all other elements assayed on the property and the correlation coefficient calculated. The three elements with the highest correlation are shown in Table 2.

Table 2: Correlation Coefficients of elements

Element	Correlation Coefficient
Silver (Ag):	**0.47**
Arsenic (As):	**0.35**
Tungsten (W):	**0.33**

Maps with these elements plotted against gridded gold values can be found in the Map Section of report (Figures 8 to 12)

Recce Traverses

The recce lines from 2017 do not highlight many new gold targets or expand on existing one sample anomalies previously identified. 2 of the 20 new recce lines resulted in gold values above 25ppb (figure 13).

Grids

The two new northerly grids, A and B, hosted in the Simpson Range Assemblage show no expansion on the original Au targets identified in the previous years recce traverses. (figure 13)

Grids C, D, and E are located in the south-eastern corner of the claim block and hosted in the Snowcap Assemblage. These three grids show significant east-west gold-in-soil surface trends that remain open along strike. The two highest gold results are found in Grid D with 330 and 259ppb (figure 13)

Interpretation

The Hayes property overall has relatively low Gold-in-Soil results. The highest result in three years of sampling and 7,511 samples is an impressive 1,078 ppb, and the second highest is 330 ppb. The 99th percentile, however, has a modest cut off of 23 ppb, which is not significantly above background gold values. Using the 50th percentile of thousands of soil samples from many projects in the region, we have concluded that the important regional lower threshold of an anomalous Au-in-soil value is 12ppb. We differ from the regional thresholds on this property in favour of more accurately defining the surface expression and extent of the more subtle gold targets found here. For this project, we have used the following threshold scheme:

90th percentile	6 ppb
95th Percentile	8 ppb
98th Percentile	14 ppb
99th Percentile	23 ppb

Dividing the property into the two major geological zones with the Simpson Assemblage in the north and the Snowcap Assemblage in the south, we see that the Snowcap has much higher rates of anomalous gold values along the entire length of it within the property, and should be considered the main target region on the property. Gold in this region is strongly structurally controlled, and Snowcap assemblage is bordered on the north by the Yukon Thrust Fault, and is split by the Big Creek Fault and its many splays (figure 13). This is ideal geology for gold mineralization and makes this a favourable target within the region worthy of more indepth exploration despite the subtle on surface gold anomalies identified to date.

Grids A and B were designed to test the surface extent of mineralization around a high gold result in previous years recce work. Both of these grids failed to return significant gold results, indicating very limited potential for future exploration at these sites.

Grid C is an expansion of a smaller grid sampled in 2014. The 2017 field season saw this grid expanded to the north, east and west, and encompassing anomalous gold values from recce lines collected in 2011 and 2014. The highest gold values from this years survey are 121.6 ppb and 102.7 ppb, however there are anomalous gold values greater than 80ppb throughout this grid from edge to edge, and particularly clustered around the middle and northwest quandrants (figure 13). Arsenic values are highest at the edges of the grid and form a nice enrichment halo around the main gold anomaly, while being relatively depleted within the anomaly itself (Figure 15). Silver has a strong positive correlation with gold in the north-west quadrant of the grid, however shows a negative correlation just south of this, and is actually haloed by the gold anomaly (figure 14). Although tungsten has a high positive correlation with gold across the property, it does not show significant pattern within the context of this grid (Figure 16).

Grid D is an expansion of a smaller grid sampled in 2014. The 2017 field season saw this grid expanded to the north and east, and encompassing anomalous gold values from recce lines collected in 2011. The highest gold values from this years survey are 329.6 ppb and 258.5 ppb

found in the eastern grid quadrant. The North-West limit of the grid also shows a zone of elevated gold-in soil that shows promise for future exploration. Arsenic values are highest at the edges of the main gold anomalies similar to grid C (Figure 15). This grid is rich in silver forming a cohesive north-west silver-in-soil trend that could indicate the trend of the mineralization in this zone. (Figure 14)

Grid E is a new grid target on samples from 2011. This grid has a nice moderate anomaly trending East-West across it with the highest gold values at 27.5 ppb. A east-west splay of the big creek fault cuts the southern portion of this grid, and seems to correspond with the southern limit of gold mineralization. Arsenic values correlate strongly with gold on this grid and are strongest along the West limit of the grid, warranting further exploration here (Figure 15).

Recommendations

It is recommended to expand Grid C to the West, North and East due to the high gold content and correlated minerals found at the grid limits.

Grid D should be expanded to the south and the east, as well as the North-West due to the high gold content and correlated minerals found at these grid limits.

Grid E should be expanded in all directions, but particularly to the West along the Big Creek Fault due to the high gold content and correlated minerals found here.

Grids A and B do not warrant further soil sampling, however the high gold results should be visited and mapped by a geologist.

Two new grids should be completed in the upcoming field seasons. One new grid should be placed around anomalous gold values found within the Snowcap Assemblage in the North-Western portion of the claim block. This zone is enriched in gold, and has strong Arsenic and Tungsten correlations. Another new grid should be placed around the South-Western gold anomaly found within the Whitehorse and Snowcap groups. This zone is also enriched with Tungsten and Arsenic.

Resistivity and IP surveys should be conducted over the mineralized zones perpendicular to the suspected strike of the zone in order to further define the structure of the mineralized zone. Geological mapping and prospecting of significant anomalies would help in the modelling efforts in order to fine-tune the geological model with accurate structural measurements.

After the surface extent and structure of the mineralized zone are modeled, RAB drilling can be utilized to test the targets for gold concentration.

Statements of Qualification

I, Chad Cote, located in Dawson City, Yukon work as a Geophysical Project Manager for GroundTruth Exploration Inc.

I have worked in the mineral exploration field since 2007. From 2007 to 2010 I worked for RyanWood Exploration for the summer field seasons as a soil sampling crew boss, MAG operator, and prospector. I joined GroundTruth Exploration for full time employment when it formed in 2010, expanding my role into GIS mapping and data management, and leading the expansion of our geophysics branch to include high resolution DC resistivity/IP and GPR surveys.

I graduated from the University of Victoria in December of 2010 with Bachelor of Science in Geography, specializing in physical systems and GIS.

Dated this 27th of November 2017 in Dawson City, YT.

Respectfully submitted

Chad Cote

CERTIFICATE OF ANALYSIS WHI17000092.1

CLIENT JOB INFORMATION

Project: HAY
Shipment ID: HAY-20170613-001-Soil
P.O. Number
Number of Samples: 254

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	254	Dry at 60C			WHI
SS80	254	Dry at 60C sieve 100g to -80 mesh			WHI
AQ201	254	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
SHP01	254	Per sample shipping charges for branch shipments			VAN

CERTIFICATE OF ANALYSIS WHI17000114.1

CLIENT JOB INFORMATION

Project: HAY
Shipment ID: HAY20170619-001-SOIL
P.O. Number
Number of Samples: 320

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	320	Dry at 60C			WHI
SS80	320	Dry at 60C sieve 100g to -80 mesh			WHI
AQ201	319	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
SHP01	320	Per sample shipping charges for branch shipments			VAN

CERTIFICATE OF ANALYSIS WHI17000115.1

CLIENT JOB INFORMATION

Project: HAY
Shipment ID: HAY20170619-001-SOIL
P.O. Number
Number of Samples: 320

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	320	Dry at 60C			WHI
SS80	320	Dry at 60C sieve 100g to -80 mesh			WHI
AQ201	319	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
SHP01	320	Per sample shipping charges for branch shipments			VAN

CERTIFICATE OF ANALYSIS WHI17000117.1

CLIENT JOB INFORMATION

Project: HAY
Shipment ID: HAY20170619-001-SOIL
P.O. Number
Number of Samples: 124

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	124	Dry at 60C			WHI
SS80	124	Dry at 60C sieve 100g to -80 mesh			WHI
AQ201	124	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
SHP01	124	Per sample shipping charges for branch shipments			VAN
