I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

PULP STORAGE : PAID STORE AFTER 90 DAYS

Certified By : _____
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Certificate of Analysis
Work Order : VC172798
[Report File No.: 0000024805]

Date: September 20, 2017

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.: PO# BMC17-01015
Project No.: KZK
Samples: 76
Received: Aug 28, 2017
Pages: Page 1 to 16
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
76	G_LOG02	Pre-preparation processing, sorting, logging, boxing
76	G_WGH79	Weighing of samples and reporting of weights
76	GE_FAA313	@Au, FAS, AAS, 30g-5ml(Final Mode)
76	GE_IMS14B	Aqua Regia digestion/ICP-MS package

Storage: Pulp & Reject

REJECT STORAGE : PAID STORE AFTER 30 DAYS
PULP STORAGE : PAID STORE AFTER 90 DAYS

Certified By : _____
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Work Order : VC172799
[Report File No.: 0000024804]

Date: September 20, 2017

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.: PO# BMC17-01015
Project No.: KZK
Samples: 76
Received: Aug 28, 2017
Pages: Page 1 to 16
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
76	G_LOG02	Pre-preparation processing, sorting, logging, boxing
76	G_WGH79	Weighing of samples and reporting of weights
76	GE_FAA313	@Au, FAS, AAS, 30g-5ml(Final Mode)
76	GE_IMS14B	Aqua Regia digestion/ICP-MS package

Storage: Pulp & Reject

REJECT STORAGE : PAID STORE AFTER 30 DAYS
PULP STORAGE : PAID STORE AFTER 90 DAYS

Certified By : _____
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Date: September 18, 2017

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.: PO# BMC17-01015
Project No.: KZK
Samples: 37
Received: Aug 28, 2017
Pages: Page 1 to 11
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
37	G_LOG02	Pre-preparation processing, sorting, logging, boxing
37	G_WGH79	Weighing of samples and reporting of weights
37	GE_FAA313	@Au, FAS, AAS, 30g-5ml(Final Mode)
37	GE_IMS14B	Aqua Regia digestion/ICP-MS package

Storage: Pulp & Reject

REJECT STORAGE : PAID STORE AFTER 30 DAYS
PULP STORAGE : PAID STORE AFTER 90 DAYS

Certified By : _____
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Project No.: KZK
Samples: 76
Received: Sep 25, 2017
Pages: Page 1 to 16
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
76	G_LOG02	Pre-preparation processing, sorting, logging, boxing
76	G_WGH79	Weighing of samples and reporting of weights
76	GE_FAA313	@Au, FAS, AAS, 30g-5ml(Final Mode)
76	GE_IMS14B	Aqua Regia digestion/ICP-MS package

Storage: Pulp & Reject

REJECT STORAGE : PAID STORE AFTER 30 DAYS
PULP STORAGE : PAID STORE AFTER 90 DAYS

Certified By : _____
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Project No.: KZK
Samples: 76
Received: Sep 25, 2017
Pages: Page 1 to 16
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
76	G_LOG02	Pre-preparation processing, sorting, logging, boxing
76	G_WGH79	Weighing of samples and reporting of weights
76	GE_FAA313	@Au, FAS, AAS, 30g-5ml(Final Mode)
76	GE_IMS14B	Aqua Regia digestion/ICP-MS package

Storage: Pulp & Reject

REJECT STORAGE : PAID STORE AFTER 30 DAYS
PULP STORAGE : PAID STORE AFTER 90 DAYS

Certified By : _____
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Project No.: KZK
Samples: 76
Received: Sep 25, 2017
Pages: Page 1 to 16
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
76	G_LOG02	Pre-preparation processing, sorting, logging, boxing
76	G_WGH79	Weighing of samples and reporting of weights
76	GE_FAA313	@Au, FAS, AAS, 30g-5ml(Final Mode)
76	GE_IMS14B	Aqua Regia digestion/ICP-MS package

Storage: Pulp & Reject

REJECT STORAGE : PAID STORE AFTER 30 DAYS
PULP STORAGE : PAID STORE AFTER 90 DAYS

Certified By : _____
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
91	G_LOG02	Pre-preparation processing, sorting, logging, boxing
91	G_WGH79	Weighing of samples and reporting of weights
91	GE_FAA313	@Au, FAS, AAS, 30g-5ml(Final Mode)
91	GE_IMS14B	Aqua Regia digestion/ICP-MS package

Storage: Pulp & Reject

REJECT STORAGE : PAID STORE AFTER 30 DAYS
PULP STORAGE : PAID STORE AFTER 90 DAYS

Certified By : _____
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Appendix N: Soil Sample QA/QC Report

EQUITY | EXPLORATION CONSULTANTS LTD.

QA/QC REPORT

DATE: 16 February 2018

PROJECT: **Kudz Ze Kayah**

CLIENT: **BMC Minerals No. 1**

PERIOD OF WORK: 28 August - 25 September 2017

SUMMARY

This report summarizes and discusses the results of the field-based quality assurance / quality control (QA/QC) program for the 2017 soil sampling campaign at Kudz Ze Kayah (KZK), and applies to the following work orders:

- VC172741
- VC172742
- VC172743
- VC172752
- VC172754
- VC172755
- VC172756
- VC172758
- VC172759
- VC172760
- VC172761
- VC172765
- VC172766
- VC172767
- VC172768
- VC172769
- VC172782
- VC172783
- VC172784
- VC172785
- VC172786
- VC172787
- VC172788
- VC172790
- VC172791
- VC172792
- VC172796
- VC172798
- VC172799
- VC172800
- VC172818
- VC173360
- VC173361
- VC173362
- VC173363
- VC173364

During the 2017 assay program there was no instances of significant blank contamination for Ag, Au, Cu, Pb, or Zn. Ninety-five percent of the field duplicates displayed an average of 29% difference for all elements.

INTRODUCTION

This report discusses the results of the field-based quality assurance / quality control (QA/QC) program for the 2017 soil sampling campaign at the Kudz Ze Kayah (KZK) Project. The QA/QC program includes insertion of blank material into the sample stream to monitor contamination. As well, field duplicate samples were submitted and analysed to test the field reproducibility of soil material. In total, 4.5% of all samples submitted to the lab are for QAQC purposes (44 blank samples and 74 field duplicates).

PROCEDURES

After pH analyses were done, groups of 5-10 soil Kraft bags were placed into a polyethylene bag, taped up and placed with 4-5 other polyethylene bags into a single rice bag for shipment. Each rice bag was sealed with a uniquely numbered security tag and then shipped to Whitehorse, YT, via Ross River-based Tu-Lidlini Petroleum and Whitehorse-based Small's Expediting, and then to SGS Canada in Burnaby, BC, with Canadian Freightways.

The SGS lab in Burnaby, BC, is an ISO 9001:2008 certified laboratory (accredited laboratory No. 744) that also conforms with the requirements of CAN-P-1579, CAN-P-1578 and CAN-P-4E (ISO/IEC 17025-2005). Soil samples were received, logged in, oven dried at 60°C and then sieved at 80 mesh (180µm). Samples were digested in aqua regia and then analysed by ICP-MS for 36 elements (SGS code GE_IMS14B). In addition, gold was analyzed by fire assay fusion of a 30 g aliquot followed by atomic absorption spectroscopy (AAS) analysis (SGS code GE_FAA313).

An additional 92 samples were analyzed by SGS for pH as a check on the onsite pH analyses. The SGS method (GE_ISE15V) also involves measurement on a soil-water paste.

RESULTS

Forty-four blank samples were submitted and assayed. A failure threshold of 10x detection limit (*dl*) returned no failures for the Ag, Au, Cu, Pb or Zn, nor many other elements (Table 1). Exceptions include Ce and Y, which averaged blank/*dl* equal to 21 and 13 respectively, However, the low ratio of standard deviation to mean (1.04 ± 0.14 ppm Ce, 0.66 ± 0.05 ppm Y) suggests that this blank material inherently contains 1.0 ppm Ce and 0.7 ppm Y.

Blank sample D00007260 returned 2.38 ppm Mo against a *dl* of 0.05 ppm, and a blank average of <*dl*. The Ce content is also 40% higher (1.43 ppm) than average. Related soil samples, however, lack Mo enrichment and so no follow-up work was done.

Seventy-four field duplicate samples were submitted and analysed, with 95% of the data showing an average percent difference of 29% for all elements. This lies just inside of the 30% threshold considered "acceptable" (SGS Mineral Services, 2005). For elements of interest, 90% of duplicate As, Au, Bi, Cu, Pb, Sb and Zn pairs returned a mean percentage difference of ≤30%, as well as 89% of Ag pairs and 86% of Hg.

Duplicate pairs for most elements show correlation (ρ) >0.9 for >95% of the population, with several key elements (Ag, As, Hg, Sb) showing ρ>0.9 for a slightly lower proportion of 90-95%. Correlation for gold, on the other hand, is exceptionally low (ρ=0.06) and includes two poorly reproduced assays of 116 ppb and 55 ppb Au, and numerous pairs that assayed at or near detection. This is not altogether unusual, however, and so gold is here used as part of the VMS Suite even though there are solid grounds to ignore this data.

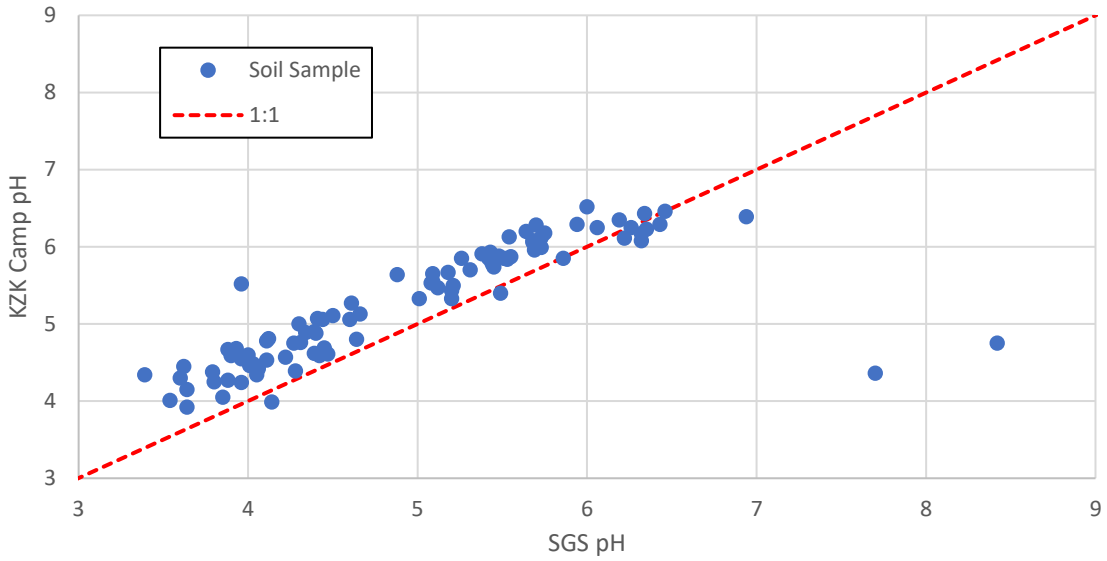

Figure 1: Comparison of pH readings taken at SGS against those taken at KZK Camp

Ninety-two umpire pH measurements done at SGS show ρ = 0.76 with KZK Camp data for 100% of the duplicates, and ρ = 0.92 for 96% of the data. The KZK Camp measurements average pH 0.4 higher than SGS (Figure 1); possibly, this is related to different water volume in the soil paste. The KZK Camp readings are therefore reliable but should be levelled when plotted with other pH data sets.

The pH analysis of 34 “gravel pit” standards, using the PT2, returned an average pH of 6.7 with a standard deviation of 0.4. Analysis of the same material with the Oakton pH meter, on the other hand, returned a mean and standard deviation of 8.3 ± 0.5. This discrepancy was recognized at KZK Camp and so all samples analysed with the Oakton were re-analyzed with the PT2. Analyses of the pH of standard solutions shows that 96% of the data has an accuracy of ±0.2.

Table 1: Detection and mineralized limits for selected precious and base metals and statistics of blank material assays

Statistic	**Ag**	**Au**	**Cu**	**Fe**	**Pb**	**Zn**
Detection limit	0.01 ppm	0.005 ppm	0.50 ppm	0.01 ppm	0.20 ppm	1.00 ppm
Mean (N = 44)	<dl	<dl	0.60 ppm	0.02 ppm	0.44 ppm	1.39 ppm
N.o. samples <*dl*	43	43	5	0	0	7
% of samples <*dl*	97.7%	97.7%	11.4%	0.0%	0.0%	15.9%
N.o. samples >10 x *dl*	0	0	0	0	0	0
% of samples >10 x *dl*	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Maximum assay	0.01 ppm	.008 ppm	1.2 ppm	0.03 ppm	0.80 ppm	4 ppm
Maximum assay/*dl*	1.0	1.6	2.4	3.0	4.0	4.0

1.0 INTRODUCTION

PROJECT ID	**DIG.CA.BMC.17.01** – Kudz Ze Kayah Project
PROJECT LOCATION	Located on the Northern Pelly Mountains, 135 km south of Ross River in south central Yukon within NTS map sheet 105G07 (**Figure 1**)
SURVEY DESCRIPTION	**Surface & Borehole Transient Electromagnetic (TEM) Survey**
OBJECTIVES	To detect, locate and characterize possible buried conductors associated with potential VMS mineralization.
CLIENT	**BMC Minerals Ltd** 530 – 1130 West Pender St Vancouver, BC V6E 4A4
CLIENT REPRESENTATIVE	**Robin Black** VP Exploration robinb@bmcminerals.com

2.0 PROJECT LOCATION, ACCESS AND PHYSIOGRAPHY

LOCATION	South central Yukon, Canada, on NTS map sheet 105G/07; at approximately 61° 28.6' N and 130° 35.46' W (NAD83 UTM Zone 9N: 415250 E and 6817000 N).
ACCESS	The properties are accessible by an existing gated 24 km tote road that extends from the Robert Campbell Highway south to the project site. The project area is well serviced by existing infrastructure that includes highways and airstrips with the towns of Ross River located about 115 kmn from the survey area, Watson Lake (237 km) and Whitehose (517 km).
ACCOMMODATIONS	Accommodations, meals and other amenities were provided by Discovery Int'l Geophysics Inc. at a temporary camp for the entire duration of the survey.
PHYSIOGRAPHY	Yukon is part of the Canadian Cordillera, the system of mountain ranges that run generally in a north-south direction. The complex topography of rugged mountains, plateaus, lowlands and valleys is a result of deposition, volcanic activity, deformation and plate movement a long the western margins of the North American craton extensively modified by glaciation, erosion and weathering. The physiography of the area varies from gentle sloping lowland to ice-covered ranges. Between these two extremes are extensive plateaus, lowlands and numerous mountain ranges. Temperatures of the area are complex showing a range from -62.8° C in winter to a maximum of 36° C in the summer.
COORDINATE SYSTEM	Datum: NAD83, UTM Zone 9N

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

3.0 SURFACE TEM SURVEY

SURVEY DESCRIPTION	The **Fixed-Loop TEM surveys** were conducted on the Kudz Ze Kayah (KZK) project. Readings were taken at 100 m intervals along survey lines with 50 m infill readings at operator discretion particularly when approaching to a possible conductor.
MEASUREMENTS	**X**, **Y** and **Z** components of the secondary EM field (B-field) using an EMIT SMART Fluxgate sensor.
PERSONNEL	Connor Harrison (Crew chief/ Senior technician) Lester Ballantyne (Assistant) Doris Palomino (Geophysicist, QC, Processing and reporting)
DATA ACQUISITION	Survey was conducted from September 02nd to September 31st, 2017. All grid lines were completed in their entirety, please refer to the Production Notes on **APPENDIX B** for more details.
SURVEY COVERAGE	Details of the survey coverage and location map can be found in **Table 1** and **2**; and **Figure 2** and **3**, respectively.
TRANSMITTER LOOP SPECIFICATIONS	2000x1500m, single turn loop, 10 AWG wire transmitter loops were employed. See **Table 3** for more details.
POLARITY CONVENTION	**X**: along profile axis, positive north. **Y**: orthogonal to **X** , positive counter clockwise to **X,** **Z**: orthogonal to **X** and **Y** positive upward The direction of current flow in the Tx loop is such that the primary field is oriented upward in the centre of the loop.
EQUIPMENT	Phoenix TXU-30 transmitter EMIT SMARTem24 receiver (3-channel, 29-36 time gates) EMIT SMART Fluxgate Sensor Subaru RVG 13000T 3-phase Generator
SURVEY PARAMETERS	**Repetition Rate (Base Frequency)**: 1.0, 2.5, 5.0 Hz **Transmitter Current**: 20 Amps **Transmitter Turn-Off Time**: 700 µs

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

	Transmitter Signal: bipolar square wave, 50% duty cycle **Transmitter Synchronization**: GPS time sync **Integration Time**: 15 seconds (256 stacks), repeat readings. **Number of gates**: 29 time gates (5.0 Hz), ranging from 0.0995 to 42.68 ms after shut-off; 32 time gates (2.5 Hz) ranging from 0.0995 to 81.67 ms after shut-off; and 36 time gates (1.0 Hz) ranging from 0.0995 to 194.0 ms after shut-off. See **APPENDIX A** for more details.
SOFTWARE	**SMARTem24**: Rx data transfer to PC via USB **SMARTem24**: Quality control **EMIT Maxwell**: Data processing and plotting
PROFILE PLOTS	Profile plots can be found in **APPENDIX C** and **D**.

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

4.0 BOREHOLE TEM SURVEY

SURVEY DESCRIPTION	**Borehole TEM Profiling**, data acquisition at 5 to 20 m intervals
MEASUREMENTS	**U**, **V** and **A (X**, **Y** and **Z** in the drill hole orientation) components of the Primary EM field (B).
PERSONNEL	Connor Harrison (Crew chief/Senior Technician) Lester Ballantyne (Survey Assistant) Doris Palomino (Geophysicist, report, QC, processing)
DATA ACQUISITION	Survey was conducted from September 05th to September 31st, 2017. See **APPENDIX B** for more details.
SURVEY COVERAGE	Details of the survey coverage and location map can be found in **Table 4** and **Figure 4**, respectively.
POLARITY CONVENTION	**A**: along drill hole axis, positive upward. **U**: orthogonal to **A** and in azimuthal direction of the drill hole, positive upward. **V**: orthogonal to **A** and **U**, positive counter clockwise to **U**. The direction of current flow in the Tx loop is such that the primary field is oriented upward in the centre of the loop.
LOOP CONFIGURATION & SPECIFICATIONS	Please see **Table 5** and **Figure 4** for more details. Borehole. Distance between Tx loops and boreholes were not constant.
EQUIPMENT	Phoenix TXU-30 transmitter EMIT SMARTem24 receiver (3-CH, 20/25/29 time gates) EMIT DigiAtlantis probe Discovery Winch Frame, Borehole cable reel to 1600 m. Subaru RVG 13000T 3-phase generator Detailed information on the survey equipment used can be found in **APPENDIX A**.

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

SURVEY PARAMETERS	**Repetition Rate (Base Frequency)**: 5 Hz **Transmitter Current**: 10.0 to 28.0 Amps. **Transmitter Turn-Off Time**: 700 to 1200 µs **Transmitter Signal**: bipolar wave, 50% duty cycle **Transmitter Synchronization**: crystal clock **Integration Time**: 15 seconds (256 stacks), repeat readings. **Number of gates**: 29 time gates ranging from 0.0995 to 42.683 ms after shut-off. See **APPENDIX A** for more details.
SOFTWARE	**EMIT SMARTem24**: Quality control **EMIT Maxwell**: Data processing, plotting and modelling
PROFILE PLOTS	Profile plots can be found in **APPENDIX E**.

Table 4: Borehole TEM Coverage

Hole ID	UTM (NAD83/ Zone 13N)	Azimuth/Dip/ EOH	Sensor	Data	Tx Loops	Frequency (Hz)	Data Surveyed From – To (m)	Total Surveyed (m)
K17-447	415055E 6816226N Elevation 1380m	Azimuth 180 / Dip -85.0	DigiAtlantis	A,U,V	1	5.0	20 - 445	425
K17-448	415452E 6817253N Elevation 1450m	Azimuth 180 / Dip -85.0	DigiAtlantis	A,U,V	1	5.0	20 - 1000	980
K17-449	414691E 6817002N Elevation 1420m	Azimuth 180 / Dip -85.0	DigiAtlantis	A,U,V	3	5.0	20 - 790	770

Table 5: Borehole TEM Transmitter Loop Specifications

Tx Loop	Dimensions (m)	Current (A)	Turn-Off Time (µs)
1	2000 x 1500	10.0 – 20.0	700 - 1200
3	900 x 900	28.0	700

5.0 SURFACE TEM DATA PROCESSING AND PRESENTATION

QA/QC

At the conclusion of each survey day, the TEM data were copied from the SMARTem24 receiver to another computer using a USB memory stick. The full TEM waveform is recorded at a high sample rate for each individual stack, therefore extremely large data files are produced each day. Full waveform recording allows post-survey processing such as stacking and windowing of the secondary TEM data. For example, post-survey processing of full waveform data may include a selective stacking procedure to help eliminate noise, or extracting the secondary response for an entirely different set of gate times than used during the original survey, or to obtain on-time or primary field data. This post-survey processing is carried out using the EMIT SMARTem24 software.

The SMARTem24 software is also used to QC the readings at each station by examining the secondary decay plots for each component. Readings with decays that are not smoothly varying with time (e.g. due to rapid sensor movements and vibrations caused by wind) or lie significantly outside the range of the majority of decays at that station (i.e. outliers caused by rapid geomagnetic variations and pulsations) are deleted from the stack. The final edited data are then written to a final EMIT format TEM data files for each line surveyed.

NORMALIZATION

All EMIT SMART Fluxgate data are automatically collected in pT/A.

PROFILES

The TEM data files are imported into another EMIT program called Maxwell, which is used to plot and model all types of EM data. Maxwell automatically reads header information from the TEM data files upon import, thus reducing human input, time and errors. Profiles for each line are created at an appropriate scale, limited by the page size. Single-page plots were created for each component on each line; consequently, three plots are created per line. Each plot displays the data of 29 (5.0Hz), 32 (2.5 Hz) or 36 (1.0 Hz) gates (SMARTem standard gate times) for each individual component, divided into three early-, mid-, and late-time

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

panels, plus a top panel showing the primary field strength. Each panel display either 9 to 10 (5.0 Hz), 7 to 8 (2.5 Hz) or 6 to 10 (1.0 Hz) time-gates as linear amplitude profiles of secondary data plotted in pT/A.

All pertinent survey specifications are also displayed on the profile plots, including window gate times (in ms), transmitter loop size, transmitted current, turn-off ramp time, transmitter-to-receiver offset, etc. for each line. The gate times are referenced from the end of the turn-off ramp to the center of the particular window. The gate times are also listed in the header information of every TEM data file. The profile plots are shown in **Appendix C** and **D**.

DELIVERABLES

The enclosed DVD contains a copy of this report and all the data associated with the surface TEM surveys.

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

6.0 BHTEM DATA PROCESSING AND PRESENTATION

ROTATION CORRECTION

DigiAtlantis borehole probes measure all three TEM components – an up-hole axial A component, plus two cross-hole (radial) components U and V. Because the probe can rotate as it descends the hole, the cross-hole measurements must be corrected by resolving them into a purely horizontal V component, plus a forward and upward pointing U component. The required rotation is preferably determined from tilt-meter outputs. These are measurements made from two orthogonal tilt-meters housed within each probe, and aligned to the fluxgate and coil sensors.

If a drill hole is close to vertical, the readings fall below the precision of the tilt meters, and the error in the calculated rotation can be very large. This happens for each probe in holes greater than about 87 degrees. In this case, the direction of the calculated primary field, in all three component directions, are used to determine the rotation correction. At each measured location, the apparent primary field direction is compared to the theoretical direction expected for a given transmitter loop location. The rotation needed to correct the primary is then applied to all secondary gates and the rotated measurements are written to an output file.

A primary field rotation correction requires accurate transmitter loop location, along with accurate probe dip and azimuth data. For a near vertical hole, the rotated U component points in the direction of the hole azimuth. If the hole is perfectly vertical, U is defined as pointing east and V points north. Primary field rotation correction does not work if the transmitter loop is exactly centered on the drill collar of a vertical hole, because there is no radial primary field component. Transmitter loops should always be offset from the collar by at minimum 10 percent of a loop side. A primary field rotation can be distorted if the primary field is significantly affected by 3D anomalies.

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

NORMALIZATION

DigiAtlantis measures the primary and secondary measurements of the B-field directly in pT and then normalised by current resulting in units of pT/A.

PROFILES

Data files are imported into EMIT Maxwell which automatically reads header information from the data files upon import, thus reducing human input, time and errors. Profiles for each component (A, U, V) and surveyed loop are prepared at an appropriate scale. Each plot displays the data in 29 (5Hz) separate gates, divided into three early-, mid-, and late-time panels plus a top panel showing the primary field strength. Each panel displays 9 to 10 (5Hz) time gates as linear amplitude profiles of the secondary EM field data plotted in pT/A.

All pertinent survey specifications are also displayed on the profile plots, including window gate times (in ms), transmitter loop size, transmitted current, turn-off ramp time, etc. for each line. The gate times are referenced from the end of the turn-off ramp to the center of the particular window. The gate times are also listed in the header information of every TEM data file. Profile plots are shown in **APPENDIX E**.

DELIVERABLES

All the data associated with the borehole TEM survey are provided in the enclosed DVD.

Respectfully submitted,

Aurora D. Palomino, B.Sc.

8.0 CERTIFICATE OF QUALIFICATIONS

Aurora D. Palomino

I, Aurora D. Palomino of the municipality of Saskatoon, in the province of Saskatchewan, hereby certify as follows:

- I am a Geophysicist with Discovery Int'l Geophysics Inc. located at 147 Robin Crescent, Saskatoon, SK S7L 6M3.
- I hold the following university degrees: Bachelor of Science, Geophysics, St. Augustine National University, 2000. Second Degree in Computer Sciences, St. Augustine National University, 2002.
- I have either no direct interest in BMC Minerals Ltd. or the above described properties and project that are the subject of this report, or intend to have any direct interest.

Dated at Saskatoon this 20th Day of November, 2017.

Aurora D. Palomino, B.Sc.

Geophysicist

APPENDICES

APPENDIX A– INSTRUMENT SPECIFICATIONS

EMIT SMART FLUXGATE

SPECIFICATIONS

- Low noise, 3-component fluxgate magnetometer sensor
- On-board accelerometers and temperature sensor
- Automated nulling and recording of the Earth's DC magnetic field
- Calibrated magnetometer and tilt outputs
- Robust housing, portable and lightweight, in-built handle
- Plug-and-play with SMARTem24 receiver
- No batteries required (powered by SMARTem24 Receiver or external battery supply
- Automated simultaneous recording of three components and tilt measurements on the SMARTem24 Receiver.
- Tilt corrections can be applied in SMARTem24 software
- Can be used with other receivers
- Precision bubble level
- Maximum signal level +/- 70,000 nT
- **Sensor noise level**: maximum 6 pT/root Hz @ 1Hz on all components
- **Noise level**: approximately 3 pT on late time window
- Bandwidth DC – 4 kHz

ELECTROMAGMETIC IMAGING TECHNOLOGY (EMIT)

SMARTem24 ADVANCED GEOPHYSICAL RECEIVER SYSTEM

- 24-bit ADCs.
- Up to 16 input channels, each with ADC and amplifier.
- Up to 120,000 samples per second on each channel.
- Light-weight and rugged environmentally sealed operating temperature range -35°C to +50°C.
- +/-20V input range.
- Separate transmitter controller with GPS and crystal synchronization.
- Powerful signal processing.
- Full 24-bit time-series recording and playback.
- Tablet touch-screen and keyboard entry.
- Download data via USB or memory cards.
- Hot-swap internal batteries.
- EM, IP and other survey types.
- Controls a range of transmitters.
- Interface to any sensor, can provide power to sensor if required.
- Powerful GUI to display signals and data.
- Surveys can be planned in the office or in the field.
- Import and display base maps.
- Add notes and comments as you go.
- Monitor survey progress in plan-view.

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

- Display scope, decays, spectra, profiles, pseudo-sections and plan.
- Standard ASCII data file formats.
- Transmitter controller has optional recording of current waveform.

SPECIFICATIONS

- **Dimensions**: 310 mm x 290 mm x 120 mm.
- **Weight**: 8 kg.
- **Input channels**: Up to 16.
- **Max input level**: +/- 20 V on gain 1; +/- 2 V on gain 10; +/- 0.2 V on gain 100.
- **Input impedance**: 10 Mohm.
- **Bandwidth**: Up to 60 kHz.
- **Sample rate**: 12.5 – 120 ksps per ADC.
- **Synchronization**: GPS, crystal, asynchronous.
- **Battery**: Dual 14.4 V Li Ion (hot swappable), external 12-28 V.
- **Battery life**: > 10 hrs (constant operation).
- **Operating system**: Windows 7.
- **Display**: 10.4” XGA 1000 nit daylight-readable colour LCD.
- **Interface inputs**: Touch, digitizer and active stylus screen, backlit QWERTY keypad, touchpad.
- **Data storage**: 160 GB HDD (or optional SSD), USB, SD and CF cards.
- **Transmitter control**: As per SMARTem24 Transmitter Controller.
- **Network**: Wireless.

SMARTem24 Software

- One program for data acquisition and post-survey processing / analysis on the instrument itself or on other PCs.
- Display of scope, spectrum analyzer, plan profile, decay and pseudo-sections.
- Preference profiles saved for each user.
- Create custom displays with multiple panels, e.g. plan, profile and decay.
- Extensive on-line help.
- Survey planning utilities and functions.
- Powerful stacking, filtering, windowing and signal processing.
- Library of sensor types and appropriate data units to select.
- Raw, stacked and processed data files generated.
- Software and firmware updates can be easily performed by the user.
- Specialized functions written on request.

SMARTem24 Transmitter Controller (optional)

- **Synchronization**: GPS, crystal.
- **Transmitter Compatibility**: Geonics, Zonge, Phoenix, Crone and others.
- **Duty cycle**: 25%, 50%, 100%.
- **Base frequency**: 50 Hz and 60 Hz selections.
- **Transmitter current recording rate (optional)**: 12.5 – 120 ksps
- **Battery**: Li Ion (or external 12 V power supply)
- **Battery life**: > 12 hrs (constant operation)
- **Dimensions**: 310 mm x 260 mm x 135 mm.
- **Weight**: 5 kg.

PHOENIX TXU-30 MULTI-FUNCTION GEOPHYSICAL CURRENT SOURCE
The most advanced controlled current source available for electrical methods exploration, the TXU-30 is compact and portable, combining power output (20kW) with great reliability, flexibility, and user-friendly operation. **Simplified MG Requirements**: The new design eliminates dependence on specialized motor generators. Now, you can buy or rent a suitable MG from any convenient local supplier. **Advanced Controls**: Advanced microprocessor control provides superior performance across the board. Large, bright LEDs display instrument status and critical values. Simple, straightforward controls make it easy to adjust all operating parameters within allowable limits. **Climate-Controlled Exploration**: Use the cable-linked remote control panel to operate the TXU-30 from up to 30 m away. Manage your EM transmissions in the comfort of a heated or air-conditioned field truck cab. **High S/N Ratios – Precision Synchronization**: In highly resistive areas in the past, users have relied on dangerously high voltages in an attempt to achieve an adequate signal-to-noise ratio at the receiver. The TXU-30's built-in GPS satellite-synchronized timing control, coupled with companion GPS-synchronized receivers, solves this problem. Because the entire system is synchronized, receivers can maintain proper registration while stacking even extremely week signals. The signals can be stacked as long as necessary until the S/N ratio is acceptable. **Wire or Wireless Data Links**: The TXU-30 continuously saves time series records of its output current and voltage on a removable 512 MB flash memory card. This information, required for deconvolution calculations in Spectral IP, can be transmitted to a companion receiver system over either a wireless or an optional cable link. Alternatively, the data on the flash memory card can be uploaded to the post-processing computer via high-speed, low-cost interface.
SPECIFICATIONS
• **Dimensions & Weight, Transmitter**: 52cm W x 44.5 cm H x 60 cm D; 52.5 kg • **Dimensions & Weight, Controller**: 47cm W x 15 cm H x 36.5 cm D; 6.5 kg • **Environmental**: Operating: -20°C to 45°C; Storage: -35°C to 50°C • **Maximum Power Output**: 20kW at 25°C, sea level • **Duty Cycle**: 100%, 50%, 33%, 25% • **Efficiency**: 90% at full power • **Current Range**: 1-40A, 0.5-20A • **Voltage Range**: 25-1000V • **Input Voltage**: 200-240V at 50/60/400 Hz • **Frequency Range**: 256 s to 9600Hz (Frequency Domain); 128 s to 30 Hz (Time Domain) • **Timing Control**: GPS synchronized +/- 0.5 µs • **User Interface**: Cable-connected control panel • **Fault Protection**: Input voltage out of range; Output voltage out of range; Output current out of range; Power stack temperature high.

EMIT DIGIATLANTIS BOREHOLE SYSTEM

DIGIATLANTIS PROBE

Sensor	3 orthogonal fluxgate magnetometers (x,y,z)
Depth Rating	3km
Max signal level	+/-70uT
Calibration accuracy	+/-0.1%
Orthogonal accuracy	0.1 degree
Sensor noise level	max. 6_T/√Hz @ 1Hz on all components
Noise level	approx. 3pT on late time window
A/D	24 bit delta-sigma
Available gain settings	1, 10 or 100
Sample rate	12.5 - 25kHz per ADC, simultaneously
Band2idth	0-4kHz
Battery	Li-Ion
Battery life	8hrs, extended with power feeding
Dimensions	2280mm x 33mm (Ø)
Weight	7kg

DIGIATLANTIS RECEIVER

The DigiAtlantis receiver is a Panasonic Toughbook 30:

- Rugged, small (300mm x 285mm x 70mm) and lightweight (3.7kg)
- 13” Touch screen colour LCD (daylight readable, 1024x768)
- Running Microsoft Windows XP
- 80Gb hard disk (upgradable to 160Gb)
- QWERTY keypad, touchpad, USB
- Single Ethernet connection to DigiAtlantis probe controller
- Operating temperatures from -20°C to +65°C
- Powered by Li-Ion battery for 8hrs (or external 12VDC or 240VAC power)

DIGIATLANTIS CONTROLLER

- **Synchronization**: GPS, crystal.
- **Transmitter Compatibility**: Geonics, Zonge, Phoenix, Crone and others.
- **Duty cycle**: 25%, 50%, 100%.
- **Base frequency**: 50 Hz and 60 Hz selections.
- **Transmitter current recording rate (optional)**: 12.5 – 120 ksps
- **Battery**: Li Ion (or external 12 V power supply)
- **Battery life**: > 12 hrs (constant operation)
- **Dimensions**: 310 mm x 260 mm x 135 mm.
- **Weight**: 5 kg.

APPENDIX B – PRODUCTION NOTES

BMC Minerals Ltd. – Kudz Ze Kayah Project – Surface and Borehole TEM Survey
September 02nd to September 31st, 2017

Crew: Connor Harrison (Crew Chief/Senior Technician) and Lester Ballantyne

Saturday, 02 September 2017: The crew departed Whitehorse, YT around 10:00am and made it to camp for 5:00pm. They got settled into their tent and made introductions with the client.

Sunday, 03 September 2017: The crew had to wait for the revised loop design this morning so they spent their time sorting through the gear inside the trailer. Once the loops were provided, the crew made their way down the road to begin laying Loop 1. They were able to get the NW corner of the loop laid out along with a 500m section of the south side. They return to camp around 3:00pm and devise a plan of attack to complete the loop tomorrow.

Monday, 04 September 2017: The helicopter was extremely busy this morning and the crew wasn't able to get their first wire drop until 10:30 – 11:00am. They started on the SW corner to complete the loop section on the western side of the road. They then, slung the basket over to the SE corner and pull the rest of the south side into place. The basket and crew were moved back to camp to reload on wire. The basket and crew then made their way out to the NE corner and the crew was able to lay 1Km in each direction before they were picked up around 6:00pm.

Tuesday, 05 September 2017: Slightly less was needed from the helicopter this morning and the crew was bumped out to the basket around 9:30am. They slung the basket ~1.2Km westward from the NE corner and laid ~500m of wire to complete the north side. They then moved to the SE corner and laid the last 500m on the east side to complete the loop. The crew was flown back to camp and they loaded up the truck with the transmitters to go set up down the road. The loop was tested and had continuity of ~23 Ohms so the transmitters were tested and the crew made their way back to camp around 3:00pm. They loaded up the basket with all the BHTEM gear (excluding instrumentation) and slung it out to K17-447 before getting flown out there themselves. They setup over the hole and began the dummy procedure which went all the way to bottom. 1they pulled the dummy out of the hole and packed up for a flight back to camp around 4:30pm before the pilot had to takeoff for an hour.

Wednesday, 06 September 2017: The crew fired up the transmitter first thing this morning with a current of 10A at a base frequency of 1Hz. They then waited for until 9:00am for the helicopter to be available before flying out to K17-447 to begin their survey. They dropped the probe down the hole and hit bottom around 447m. They pulled back up to 445m and took their first readings. The survey was carried out at mainly 20m intervals with some 10m intervals at the bottom of the hole and around 180m. The crew surveyed until 4:00pm when the probe battery died at 40m. They pulled the probe out and loaded everything into the basket to be slung back to camp prior to the crew departure for camp.

Thursday, 07 September 2017: The crew made their way out to the transmitter to fire it up but the loop had been broken. The crew did some checks along the road to make sure it wasn't obvious before heading back to camp. They grabbed some gear for loop repair and made their way to the helipad. Once the helicopter was available, the crew flew the loop and found a section on the north side that had definitely been crossed by an animal. They landed to check it out but there did appear to be any breaks so they continued to fly the loop. Finally, they found the break and after a 600m walk to access the break, they had it fixed and waited to be picked up again. The crew flew back to camp and ensured everything was ready for the BHTEM higher frequency survey before heading to K17-447 around midday. The probe was dropped to the bottom of the hole and the survey began around 12:40pm. Surveying at 5Hz was much faster and allowed the operator to conduct many more readings per station to combat the movement noise. They finished up the hole around 4:00pm and prepared the BHTEM gear to be slung back to camp. The gear and crew were taken back to camp by 5:00pm.

Friday, 08 September 2017: After receiving a large transmitter (Phoenix TXU-30) the night before, the crew went to swap out the transmitter at Km22 Tx site. This took about 1:30Hrs to ensure that everything was in working order. Around 9:30am, The crew began to make their way west of the Tx site ~250m to their starting station (L4050E7500N) for the Fluxgate FLTEM survey. They surveyed south and completed the first line by 1:00pm. The crew then made their way east 300m to the south end of the next line (L4350E). They began to survey northbound and complete their second line by 4:30pm for a total of 3.4Km survey coverage.

Saturday, 09 September 2017: The crew spent the first hour of the morning conducting some computer work before heading out to the field. Around 9:00am, the crew fired up the transmitter and fuelled up the generator before making their way to the end of the line extension of L4050E. The crew completed the line extensions of L4050E and L4350E before getting started on the new line. They began surveying L4650E around 11:00am and surveyed southbound from station 8000N. Around 2:00pm, The power cut out on the loop and the crew chief had an ~800m walk to check what was wrong. It turned out that there were some input power issue from the generator, but it took several attempts to resolve which slowed the survey significantly. They crew surveyed down to station 5900N by 4:45 before the power kicked out again and they made the call to end the survey day. Upon further investigation, the crew found that the fuel filter on the generator fuel valves was caked with dirt and debris. They clean this out in anticipation that the issues would be resolved for the next survey day. Total survey coverage of 3.1Km, not including overlap stations for the line extensions.

Sunday, 10 September 2017: The crew made their way out to the transmitter around 8:00am, fuelled up the generator and fired up the loop. They then drove down the road to the south end of the lines and walked over to their starting station, L4950E5800N. They began surveying around 8:45 am and began northbound on L4950E. The line was fairly decent for walking and the crew was able to make good time on the survey. They completed the first line shortly before midday and bush-crashed east ~300m to the next line. They surveyed back south on L5250E and completed the line around 4:30pm before making their way back to the truck. The crew drove back to camp, shutting down the transmitter on their way. Total survey coverage of 4.4Km was achieved.

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

Monday, 11 September 2017: The crew fired up the transmitter around 8:15am before heading back to camp. They waited for the helicopter to finish sling operations and then got bumped out to their starting station, L5550E5800N. They noticed a moose cow and calf on their flight out but fortunately they did not pass through the loop wire. The crew began the survey northbound and finished the first line by 1:00pm. The bush was extremely thick for the majority of the day and the crew was slowed down significantly. They bush-crashed 300m over to L5850E and began surveying southbound. The crew surveyed down to 6200N before calling the helicopter in for a pick up around 5:00pm.

Tuesday, 12 September 2017: The initial plan for the day was to conduct the BHTEM survey of K17-448 but the crew were quickly re-informed that the drill would keep turning until tomorrow and that they should just continue on with the FLTEM survey of loop 1. They went out to the transmitter to fire up the loop before heading back to camp to catch a ride out to the field. They were dropped off at the north end of L6150E and they began surveying south. They completed the line around 1:00pm and moved over to L5850E5800N to finish off the line from yesterday (up to station 6250N inc. overlap for data merging). L5850E was completed around 2:00pm and the crew was bumped over to the north end of L6450E to begin surveying southbound, down the hill. They completed the survey around and arranged to be picked up around 5:00pm.

Wednesday, 13 September 2017: With the hole still being drilled today, the crew decided to go out and survey L4750E at 1Hz. They made their way out to the transmitter to fire up the loop before walking to their starting station (8000N). They began surveying southbound on the line at a slightly slower pace due to the lower frequency being used. Half way through the day, one crew member walked back to the truck to move it to the end of the line. The crew was able to survey down to 5000N, thus completing the line just before 4:00pm.

Thursday, 14 September 2017: The crew was on standby for the entire day waiting for the completion of K17-448.

Friday, 15 September 2017: The crew made their way out to the drill right after firing up the transmitter around 8:00am. They got themselves set up in the drill shack and began dummy probing hole K17-448 around 9:00am. The dummy was only able to go down to ~680m before it hit some sort of blockage. They crew attempted to pass through several times but could not get the dummy down. They began to bring the dummy back up but the dummy got stuck on the drill bit around 240m. The crew tried to pass through the bit several times and eventually they were able to get up into the rods however the sheer pin must have broken and the dummy was lost down the hole. The crew informed the project geologist of the situation and they were advised to wait at the drill until 11:30am – 12:00pm when the new driller arrived so that they could bring him up to speed. They then returned to camp to get some rest in anticipation for a night shift. The drillers reamed all the way down to bottom and were able to recover the dummy with ease before pulling the roads back up to ~720m. The survey crew went back up to the drill around 7:00pm and waited for the drillers to finish washing the hole. They began to set up the BHTEM system and dropped the probe down around 8:30pm. They started off at station 740m and surveyed down in 20m increments to 1000m.They started to pulled the probe out of the hole and had the BHTEM system out of the drillers way by midnight.

Saturday, 16 September 2017: The crew waited for the drillers to pull up to ~300m which was accomplished by 2:30am. The crew got their BHTEM system set up again and dropped the probe

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

down to the starting point at 320m. The surveyed down in 20m intervals to 660m before they hit a blockage at~662m. The decision was made not to bother reaming down again and the crew pulled the probe back up the hole, conducting 10m infill stations from 410m – 370m. They had the BHTEM system out of the way by 6:00am and the drillers began pulling the rest of the rods. The hole was free of rods by 7:30am and the crew set up the BHTEM system again for the final section. They surveyed down from 20m to 300m and completed the hole by 9:30am. The crew pulled the probe and packed all the BHTEM gear into the basket ready for slinging. The crew and gear were back at camp by 10:30am.

Sunday, 17 September 2017: The crew had a quick helicopter safety briefing this morning on the AS350 B3 before flying out to cut the loop 1 wire on the east and south side. They then returned to camp to drive down the road and wrap up what they could (500m east from the road on the south side and 500m south from the Tx on the west side). They then return to camp to load up the basket with the winder and empty spools. The crew and basket were bumped to the SW corner first to wrap wires to the east and north. They then got bumped over to the NE corner to wrap wires from the south and west. Finally, they moved to the SE corner to wrap the remaining wires of loop 1 that would not be used for loop 2. The crew flew back to camp after slinging back the basket and loaded up the truck with a couple kilometers of wire. The drove down the road to the NW corner of loop 2 and laid 500m eastbound before laying other 500m southbound. The crew finished off the day by laying out the western 300m of the south side.

Monday, 18 September 2017: The crew started off their day by loading up the basket with everything needed to lay out 4.0Km of wire. They then went to fly in the helicopter to pick wire drop locations around loop 2 before getting dropped off at the SW corner. Once they had the basket, the crew laid out 1.0Km northbound on the west side before getting bumped over to the SE corner. From there, they laid out another 1.0Km northbound on the east side. They got bumped again to the NE corner where they laid 500m southbound on the east side and then 970m westbound on the north side. They got their final bump to the creek on the north side where the laid out 310m to the west and 230m to the north to complete loop2. The crew returned to camp to go test the loop but is what broken. The flew to find the break which was on the pre-laid south side and they were able to fix the issue with ease. The crew finished off the day by taking the Tx generator back to camp and conducting a full service on the motor.

Tuesday, 19 September 2017: The crew went to fire up their transmitter first thing this morning. They then drove to the starting location for the FLTEM coverage and began setting up the SMARTem24 project for the day. Unfortunately, the license key for the acquisition software had expired and the crew had to return to camp. The crew spent the entire day waiting for a new license key from EMIT (Australia) which didn't arrive until the evening.

Wednesday, 20 September 2017: The crew had to fix a break in their loop first thing this morning. The loop was fairly easy to fix and the crew was able to fire up the transmitter and begin surveying by 9:30am. They started at L4050E9000N at a frequency of 2.5Hz and surveyed southbound. The first line was completed by 12:00pm and the crew bush-crashed over to the next line. They surveyed the second line north bound and completed that survey by 2:30pm. The bush-crashed over to L4650E9000N and began surveying southbound. They were able to survey 600m of L4650E before

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

they began walking back up the hill to the truck. They went to shut off the transmitter and returned to camp by 5:00pm.

Thursday, 21 September 2017: The crew woke up this morning to a request for 500m line extensions to the south. They made their way to the transmitter to fire up the loop before continuing to Km22.5 where they parked the truck. They hiked ~400m up the hill to their starting location (L4050E9000N). They surveyed northbound, conducting a two station overlap at 7500N and 7600N for data merging purposes. They then bush-crashed over 300m to L4350E7600N and surveyed south to 7000N. The crew then bush-crashed again to L4650E7000N and began surveying northbound. They completed the remaining stations of L4650E by 2:00pm and began making their way to L4950E8000N (with the intent of surveying 8000N to 9000N) They were able to survey 300m but when they start acquisition on the 5th station, they realized that the loop had been broken. Connor was picked up by the Helicopter around 2:45pm and flown to the East side of the loop where they suspected the break was. The break was found where a moose had walked through, but the wire broke 250m away. That 250m section was rerouted by the moose around multiple trees and therefore had to be pulled straight and relayed correct. The loop was fixed by 4:15pm by which point the crew decided that it was best just to catch a ride back to the truck while the helicopter was already in the air. The crew got back to camp shortly after 4:30pm.

Friday, 22 September 2017: The crew was asked to add another 500m extension to the Loop 2 lines, this time to the north. They drove down to the transmitter to power up and realized that a moose had gone through the transmitter site and taken dragged one of the loop wires out of place. Once they had found the wires and relayed it back to the transmitter, they tested the loops continuity, and it was still broken. They made their way back to camps and went up in the helicopter to find the break. The crew flew the loop twice but were unable to find the break in the wire. They returned to camp and then proceeded to lay wire down the road with the truck to see which side of the road the break was on. They found it was broken on the east side of the road and began walking the loop. The break was found down by the creek on the south side where a moose or caribou had chew through the wire. The loop was repaired and the crew was able to start surveying around 12:00pm. They surveyed the 500m extensions to the north of lines 4050E, 4350E and 4650E before surveying from 9500N to 8500N on L4950E. Total coverage of 2.5Km was achieved in the afternoon.

Saturday, 23 September 2017: The crew went to fire up the transmitter first thing this morning. Once the power was on, the crew returned to camp to catch a flight out to their starting station. They decided to start surveying back from the east and therefore began their day at L5850E9500N. They surveyed the line southbound and finished around 12:30pm. They then bush crashed 300m over to the next line and began surveying L5550E northbound. They were able to finish the second line around 4:30pm before making their way to find a pick-up location. Total coverage of 5.0Km.

Sunday, 24 September 2017: The crew made their way out to the north end of L5250E to begin their day. They surveyed progressed a little than the previous day due to the conductors not being as strong but the crew was still able to move at a decent pace. They finished L5250E around 2:00pm and moved over 300m to the south end of L4950E. They began surveying northbound and completed the line to where they had surveyed before around 4:00pm. Total Coverage of 4.0Km.

This document may contain proprietary and/or confidential information. This document is a controlled document. The controlled copy is maintained electronically by the Company Secretariat. Any printed copy of this document is an uncontrolled copy.

Monday, 25 September 2017: The crew was on standby for the entire day waiting for the completion of K17-449. One crew member stayed busy by wrapping wire and organizing equipment while the other helped out in the core shack.

Tuesday, 26 September 2017: The crew was on standby for the entire day waiting for the completion of K17-449. One crew member stayed busy by wrapping wire and organizing equipment while the other helped out in the core shack.

Wednesday, 27 September 2017: The crew was on standby for the entire day waiting for the completion of K17-449. One crew member stayed busy by wrapping wire and organizing equipment while the other helped out in the core shack.

Thursday, 28 September 2017: The crew chief had some computer work to keep busy with in the morning. After lunch, the crew mobilized to the field to lay out Loop 3 (1000m X 900m). They laid out all but 900m of the loop by 5:00pm before heading back to camp.

Friday, 29 September 2017: The crew laid out the final part of Loop 3 quickly this morning before heading back to camp. They were informed that the hole might be shut down tonight and were advised to get some rest for a night shift. The crew was informed that the drill had shut down around 11:30pm and they planned for a 4:00am departure from camp to the drill.

Saturday, 30 September 2017: The crew woke up at 3:00am and began getting the equipment loaded in the truck. They left camp around 4:00am and went to power on the transmitter loop. The loop was still intact and they continued on to the drill. The BHTEM system was setup and functional by 5:00am and the crew began to survey going down the hole. They surveyed down in 20m increments and reach a TD of ~796m (Last station recorded at 790m). They then pulled the probe out of the hole, conducting a few 10m in fill stations along the way. The probe was out of the hole by 9:30am and they crew loaded up the basket of gear before departing the drill. They returned to camp for a few hours rest prior to lunch. After lunch, they proceeded to wrap up Loop 3 and pack up the transmitter site. They returned to camp around 4:00pm and loaded up the trailer/packed up the gear around camp.

Sunday, 31 September 2017: The crew departed from KZK Camp early in the morning with intentions of driving to Fort Nelson, BC. They expect to be back at the Base of Operations in Saskatoon, SK on Tuesday afternoon.

SURVEY PARAMETERS

Configuration	: Fixed-Loop TEM
Station Spacing	: 100 m

RECEIVER

Receiver	: SMARTem24
Frequency	: 5 Hz
Component	: Z,X,Y
Rx Sensor	: EMIT SMART Fluxgate

TRANSMITTER

Transmitter	: Phoenix TXU-30
Loop	: Loop 1
Tx Loop Side	: 2000 m x 1500 m
Tx Turns	: 1
Tx Current	: 20 A
Turn Off	: 0.7 ms

Scale 1:20000

SURVEY PARAMETERS

Configuration	: Downhole
Station Spacing	: 10-20 m

RECEIVER

Receiver	: SMARTem24
Frequency	: 5 Hz
Component	: A,U,V
Rx Sensor	: Digi-Atlantis B-Field

TRANSMITTER

Transmitter	: Phoenix TXU-30
Loop	: Loop 3
Tx Loop Side	: 900 m x 900 m
Tx Turns	: 1
Tx Current	: 28.0 A
Turn Off	: 0.7 ms

Scale 1:8000

Appendix Q: Geological Drill Logs

This appendix contains all of the drill logs generated from the 2017 drilling program, which includes exploration, hydrogeological and geotechnical holes. Drill logs are placed in hole number order with the first page of each log starting on the page number indicated in Table Q-1.

Table Q-1: Table of contents for 2017 diamond drill hole logs in this appendix

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K17-420

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger	Date Logging Start:	6/24/2017
UTM Easting	414858.1094	Core Size:	HQ3	Azimuth:	50	Date Logging Complete:	6/28/2017
UTM Northing:	6815671.704	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	New Age
UTM Elev. (m):	1395.538	Casing Depth (m):	6	Length (m):	200	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title	KZK	Drill Started:	6/23/2017
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/26/2017
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
Comments:						Parent Hole:	

K17-420 was drilled to study the geotechnical properties of the proposed open pit high-wall. Optical and acoustic televiewer surveys were completed on the borehole.
Overburden extends to 4.47 m depth. The felsic volcanic and volcano-sedimentary package extends throughout the hole, with significant alteration from 141.55 m to 200 m (EOH). Disseminated to stringer sulfide (OJ; sphalerite + chalcopyrite + pyrite) occurs from 176 m to 185.57 m and massive sulfide (OC; pyrite + pyrrhotite + sphalerite + chalcopyrite) occurs from 185.57 m to 186.39 m. Moderate to strong muscovite alteration begins at 141.55 m and extends to 176 m, where strong proximal alteration (chlorite + cordierite + albite) alteration begins. The strong proximal alteration extends to 186.61 m and is associated with the disseminated to stringer mineralization and the massive sulfide. In the footwall of the mineralization moderate to strong muscovite alteration extends to 200 m (EOH).

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Hydro
Comments:						Parent Hole:	

K17-421 was drilled to help evaluate geotechnical and hydrogeological characteristics of the Class A storage facility.
K17-421 encounters intercalated mudstones and mafic volcanics (altered to ankerite) from the Wind Lake Formation. An intermediate intrusion occurs from 29.54 to 37.20 m depth. Chlorite and carbonate alteration occurs throughout the hole.

Downhole Surveys:

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 0.80 OVBN Overburden

0.80 6.10 MDSc Carbonaceous dominant mudstone

0.8 - 6.1: Laminated mudstone, calcite foliations concordant with the laminations. Carbonate abundance variable over interval. Intercalation of highly oxidized ankerite layer 20cm at 3.6m depth. Alpha angle on foliations 70 degrees.

<<Alt: 0.8 - 3.3 Trace Calcite>> Banded/wispy carbonate concordant to foliation.

<<Alt: 3.3 - 3.6 Moderate Ankerite>> Mafic volcaniclastic protolith

<<Alt: 3.6 - 6.1 Trace Calcite>> Banded/wispy carbonate concordant to lamination.

<<Vein: 3.3 - 22.88 5% Quartz-Carbonate 55 deg. >> Large (60cm) to hairline quartz/calcite veins mostly concordant to foliation. Quartz to calcite ratio variable.

6.10 9.30 MAFt Undifferentiated mafic volcaniclastic

6.1 - 9.3: Mafic tuff heavily altered to ankerite. Original fabrics & mineralogy nearly unrecognizable. 50cm quartz veins on contacts with overlying & underlying mudstone units.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 6.1 - 6.2 Moderate Ankerite>>

<<Alt: 6.64 - 8.67 Moderate Ankerite>> Some intercalated qtz veins (minor component of interval)

9.30 14.14 MDSc Carbonaceous dominant mudstone

9.3 - 14.14: Laminated mudstone, strongly deformed/folded in some places. 1 cm to 10 cm quartz veins concordant to laminations. Carbonate foliation abundance decreased from previous MDSc interval.

<<Min: 12.92 - 13.13 5% Min: Pyrite>>

<<Alt: 9.35 - 11.25 Trace Calcite>>

<<Alt: 11.5 - 11.95 Moderate-Strong Ankerite>>

<<Alt: 11.95 - 12.01 Moderate Muscovite>>

<<Alt: 12.01 - 12.92 Trace Calcite>>

<<Alt: 12.92 - 13.13 Moderate-Strong Ankerite>>

<<Alt: 13.13 - 14.14 Trace Calcite>>

<<Struc: 11.3 - 12.15 Weak Fault>>

14.14 14.56 MAFt Undifferentiated mafic volcaniclastic

14.14 - 14.56: Foliated mafic tuff layer moderately altered to ankerite. Ankerite is strongly oxidized.

<<Min: 14.14 - 14.56 4% Min: Pyrite>> + disseminated blebs

<<Alt: 14.14 - 14.56 Moderate Ankerite>> Gradational, intensifies down hole

14.56 18.45 MDSc Carbonaceous dominant mudstone

14.56 - 18.45: Laminated mudstone. Deformed in relatively small portion of the interval proximal to quartz veins. Contains large quartz veins > 10cm and stringy carbonate veins & veinlets cross-cutting the laminations. Minor fault in ankerite interval at 15.1m

<<Alt: 14.56 - 15.06 Trace Calcite>>

<<Alt: 15.06 - 15.41 Moderate-Strong Ankerite>> Adjacent to qtz vein & fault zone

<<Alt: 15.41 - 18.45 Weak Calcite>> Discordant stringy veins/clusters.

<<Struc: 15.13 - 15.34 Moderate Fault>> Heavily brecciated in AK alteration

18.45 21.37 MAFt Undifferentiated mafic volcaniclastic

18.45 - 21.37: Mafic tuff heavily altered to ankerite. Weakly foliated throughout interval. Qtz veins <1.5 cm abundant in upper meter of interval.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 18.45 - 19 4% Min: Pyrite>>

<<Min: 19 - 21.37 0.1% Min: Pyrite>>

<<Alt: 18.45 - 21.37 Moderate Ankerite>> More intense at upper & lower contact (~5 intensity)

21.37 22.35 MDSc Carbonaceous dominant mudstone

21.37 - 22.35: Laminated mudstone weakly deformed. Stringy calcite veins concordant or discordant with laminations.

<<Alt: 21.37 - 22.35 Trace Calcite>> Concordant to laminations.

22.35 22.88 MAFt Undifferentiated mafic volcaniclastic

22.35 - 22.88: Interval of mafic tuff heavily altered to ankerite. Calcite veins up to 2 cm throughout interval concordant to the weak foliation. Drill core surface is highly oxidized and fractures are completely oxidized.

<<Min: 22.35 - 22.88 1% Min: Pyrite>>

<<Alt: 22.35 - 22.88 Weak-Moderate Ankerite>>

22.88 27.50 MDSc Carbonaceous dominant mudstone

22.88 - 27.5: Laminated mudstone minorly deformed with intercalated calcite bands concordant with laminations. Upper and lower contacts with oxidized ankerite interval are sharp. Large quartz veins 0.5 to 2cm are present and cross-cut the laminations. Contains an oxidized ankerite interval ~20cm.

<<Min: 23.03 - 23.24 0.1% Min: Pyrite>> Present in 1mm calcite veinlets

<<Alt: 22.88 - 23.91 Trace Calcite>>

<<Alt: 23.91 - 24.12 Moderate Ankerite>>

<<Alt: 24.12 - 27.6 Trace Calcite>>

27.50 27.90 MAFt Undifferentiated mafic volcaniclastic

27.5 - 27.9: Mafic tuff altered to ankerite-dominant layer akin to previous ankerite intercalations. Weakly foliated and heavily oxidized. Possibly muscovite? Upper contact is an 11 cm quartz vein and lower contact contains elongated lenses of pyrite <1 cm thick.

<<Min: 27.79 - 27.9 5% Min: Pyrite>> elongated lenses

<<Alt: 27.6 - 27.9 Moderate Ankerite>>

<<Vein: 27.5 - 27.6 95% Quartz-Carbonate 60 deg. >> 90% Qz

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

27.90 29.54 MDSc Carbonaceous dominant mudstone

27.9 - 29.54: Laminated mudstone weak to moderate deformations (some crenulations present), minor carbonate component concordant with laminations. Heavily fractured at 29m but no gouge. Sharp upper & lower contacts with ankerite-dominated unit.

<<Alt: 27.9 - 29.54 Trace Calcite>>

29.54 37.60 INT undifferentiated (granitic) intrusive rocks

29.54 - 37.6: Massive intermediate intrusion. Speckled equigranular biotite throughout the unit that rarely deviates from its 1mm crystal size and 10% abundance. Calcite and plagioclase crystals also present in similar size. Calcite and/or quartz veins occur throughout up to 3 cm. Medium grey groundmass with minor chlorite. Gradational ankerite alteration present in the uppermost 0.6 m and lowermost 0.4 m, where the alteration intensifies towards the contacts. Large karst voids present from 29.55 m to 29.90 m from former calcite veins.

<<Alt: 29.54 - 30.12 Strong Ankerite>> Gradational, most intense at top of sequence with large karst voids.

<<Alt: 30.12 - 37.2 Trace Calcite>> Large quartz/calcite veins up to 8cm, discordant with the weak foliation.

<<Alt: 37.2 - 37.6 Moderate Ankerite>> Gradational, most intense at bottom of sequence.

<<Vein: 29.54 - 36.4 3% Calcium carbonate/Carbonate>> Primarily carbonate veins with 1 large Qtz/Carbonate vein

37.60 40.65 MDSc Carbonaceous dominant mudstone

37.6 - 40.65: Laminated weakly deformed mudstone. Carbonate foliations concordant with the laminations throughout interval at variable abundances. Stringy veins cross-cutting the laminations (follows orientation of core axis) present along bottom of interval. 5 cm massive quartz vein present at 40.25 m, and below it carbonate presence becomes intense which includes foliations and veins up to 8 cm. However the mudstone laminations and carbonaceous layers are still preserved in where there are no veins.

<<Alt: 37.6 - 40.22 Trace Calcite>>

<<Alt: 40.27 - 40.65 Weak Calcite>> Veins concordant to foliation, disconcordant veins, and large veins up to 8 cm.

<<Vein: 40.23 - 40.65 40% Quartz-Carbonate 70 deg. >> Massive + veinlets

End of Hole @ 40.65

UTM Northing:	6815638.611	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	New Age
UTM Elev. (m):	1412.02	Casing Depth (m):	10.5	Length (m):	221	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title:	KZK	Drill Started:	6/27/2017
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/30/2017
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
Comments:						Parent Hole:	

K17-422 was drilled to study the geotechnical properties of the proposed open pit high-wall. Optical and acoustic televiewer surveys were completed in the borehole.
Overburden extended to a 2.8 m. The felsic volcanic and volcano-sedimentary package, consisting of intercalated volcaniclastic rhyolite, coherent rhyolite, and meta-pelites, occurs throughout the hole, with significant alteration from 140.2 to 215.9 m. Strong muscovite alteration begins at 140.2 and extends to 146.88 m, where strong proximal alteration begins (chlorite + cordierite). The proximal alteration extends to 150.23 m and is associated with stringer style mineralization (OJ; pyrrhotite + chalcopyrite +/- pyrite) and massive sulfide (OG; chalcopyrite + pyrrhotite +/- pyrite). The massive sulfide occurs from 148.5 to 149.66 m. Below this zone of proximal alteration, strong muscovite alteration extends from 150.23 to 156.25 m. From 156.25 to 165.65 strong proximal alteration exists with OJ style mineralization. From 165.65 to 215.9 moderate to strong muscovite +/- chlorite alteration exists associated with local zones of increased disseminated sulfides (sphalerite + pyrite).
Disseminated to stringer style sulfides (pyrrhotite + chalcopyrite +/- pyrite) within strong chlorite-cordierite alteration zones (OJ) occurs from 146.88 to 148.5 m, 149.66 to 150.23 m, and 156.25 to 165.65 m and massive sulfide (OG; chalcopyrite + pyrrhotite +/- pyrite) occurs from 148.5 to 149.66 m. Strong muscovite alteration occurs above, below, and between the zones of proximal alteration.

						Parent Hole:	

Comments:

K17-423 was drilled to evaluate geotechnical and hydrogeological characteristics for the proposed Class A storage facility. Core comprises intercalated mafic volcaniclastic and mudstone of the Wind Lake Formation, with high calcareous content in the form of calcite bands and veins.

0.00 1.49 OVBN Overburden

1.49 28.40 MAFt Undifferentiated mafic volcaniclastic

1.49 - 28.4: Package of mafic volcaniclastics with minor chlorite in groundmass. Weak to non-foliated and variable modes & crystal sizes of biotite and calcite throughout the unit. Biotite modes range from 0-40% with crystals up to 2mm. 1mm ankerite crystals can be present up to 20% of mode. Calcite banding =< 1cm can be present concordant to the foliation, and larger (up to 0.7m) calcite/quartz veins present discordant to foliation.

<<Min: 1.49 - 20.76 0.1% Min: Pyrrhotite>>

<<Min: 20.76 - 21.5 1% Min: Pyrite>> Some cubic pyrite crystals up to 5mm

<<Min: 22.49 - 40.79 0.1% Min: Pyrrhotite>>

<<Alt: 1.49 - 40.79 Weak Calcite>> Calcite bands/foliations (at variable thickness) throughout all units. Accounts for ~4% of total mode.

<<Vein: 2.07 - 20.5 5% Quartz-Carbonate 55 deg. >> Quartz/Calcite veins with variable relative abundance. Mostly concordant with the foliation however discordant veins are present. Most are ~1cm however large veins up to 18cm are present.

<<Vein: 20.76 - 22.49 70% Quarzt-Tourmaline-Sulphide>> Irregular quartz-tourmaline-sulphide-calcite-muscovite vein orientated along the core axis. Muscovite is present in a massive texture while the other minerals are intertwined.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 23.07 - 30.82 4% Quartz-Carbonate 60 deg. >> Quartz/Calcite veins with variable relative abundance. Mostly concordant with the foliation however discordant veins are present. Most are ~1cm however large veins up to 8cm are present.

28.40 37.38 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

28.4 - 37.38: Laminated mudstone with high abundance of calcite. Calcite can be present in fine-grained layers as well as coarser lenses/foliations. Graphitic sections are present but overall weakly to moderately graphitic. Laminations are deformed in some sections.

<<Vein: 36.64 - 36.77 25% Calcite>> Irregular shape

37.38 40.79 MAFt **Undifferentiated mafic volcaniclastic**

37.38 - 40.79: Mafic volcaniclastic with chlorite & calcite in groundmass. Calcite blebs and layers present and in total account for ~20% of the mode. Speckled biotite crystals ~1mm accounts for 5% of the mode. Appears more chloritic than previous MAFt interval. 1mm ankerite crystals account for 7%.

Comments:						Parent Hole:	

K17-424 was drilled to study the geotechnical properties of the proposed open pit high-wall. Optical and acoustic televiewer surveys were completed in the borehole.
Overburden extended to 4 m depth. Hanging wall felsic volcanic and meta-sedimentary rocks extend to 134.59 m depth, with moderate to strong muscovite +/- patchy chlorite alteration from 120.72 m to 133.59 m. Strong to intense cordierite exists from 133.59 m to 135.6 m. From 134.59 m to 138.22 m, semi-massive (OC) and massive sulfide (OA) occurs. The footwall of the mineralization consist of strongly muscovite/sericite-altered rhyolites and mafic intrusives (158.93-163.35 m and 164.43-165.07 m) to a depth of 170 m.

						Parent Hole:	

Comments:

K17-425 was drilled for geotechnical and hydrogeological studies for the proposed Class B storage facility. Lithology is predominately a large carbonaceous mudstone package with minor intercalations of mafic volcaniclastic. Numerous faults, with moderate to strong intensity, occur throughout the hole.

Downhole Surveys:

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 1.80 OVBN Overburden

1.80 6.32 MAFt Undifferentiated mafic volcaniclastic

1.8 - 6.32: Heavily oxidized mafic volcaniclastic with intercalated mudstone no greater than 13 cm. Quartz-Carbonate veins are present up to 20 cm. Foliated muscovite-dominated interval present at the bottom of the sequence and has a sharp contact with the underlying mudstone unit.

<<Min: 6.12 - 6.32 2% Min: Pyrite>> Hosted in carbonate veins or veinlets in the volcaniclastic

<<Alt: 1.8 - 40.82 Moderate Calcite>> Primarily 1mm to 8mm bands of calcite concordant to the laminations of mudstone. Quartz-Carbonate veins also up to 8cm in the mafic volcaniclastic and mudstone, with greater abundance in the mafic unit.

<<Vein: 1.8 - 40.82 5% Quartz-Carbonate 80 deg. >> Quartz calcite veins typically 1 mm to 1 cm concordant with mudstone laminations and weak foliation of the mafic volcaniclastics. Quartz to Calcite ratio within the veins vary but is predominantly calcite. Abundance of the veins increase in the mafic volcaniclastics.

Larger 2-20 cm Quartz/Calcite veins also occur and are spread out over the hole (no closer than half a meter apart).

<<Vein: 1.8 - 40.82 0.1% Calcite-Ankerite>> Stringy carbonate veins 1 mm to 3mm in size cross-cutting mudstone laminations.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 3.32 - 6.12 Moderate Fault>> Fault zone with intervals of heavily fractured material in both the mudstone and mafic volcaniclastic units. Fault gouge present in an interval at ~5.5 m depth.

6.32 8.00 MDSc Carbonaceous dominant mudstone

6.32 - 8: Dark laminated mudstone with high calcareous content. Calcareous occurs as bands concordant to the laminations as well as wispy/stringy veinlets cross-cutting. Mudstone/Calcite deformed and folded in some sections. Sharp contacts with overlying and underlying mafic units.

8.00 10.25 MAFt Undifferentiated mafic volcaniclastic

8 - 10.25: Mafic volcanicastic with high carbonate content. Calcite occurs as bands (up to 9cm) concordant to the foliation as well as in the groundmass. Chlorite in groundmass gives the rock unit a pale olive-green colour.

10.25 11.33 MDSc Carbonaceous dominant mudstone

10.25 - 11.33: Dark laminated mudstone with high calcareous content. 5 cm Quartz-Calcite veins and wispy/stringy calcite bands occur concordant to laminations. Fault occurs in muscovite-banded section at ~10.75 m depth. Upper and lower contacts are sharp with the mafic volcaniclastic unit.

<<Struc: 10.37 - 10.65 Moderate Fault>> Fault-gouge present.

11.33 12.69 MAFt Undifferentiated mafic volcaniclastic

11.33 - 12.69: Mafic volcaniclastic, pale olive-green colour with chlorite and calcite in groundmass. Calcite also occurs in bands/globs. Muscovite alteration occurs gradationally near the contacts with the overlying & underlying contacts (strengthens towards the contacts).

12.69 40.82 MDSc Carbonaceous dominant mudstone

12.69 - 40.82: Dark laminated mudstone with high calcareous content. Carbonate predominately calcite which occurs in bands concordant with the laminations, larger (up to 7 cm) quartz-carbonate veins, and stringy veinlets that cross-cut the laminations. Globs/disseminated sulphide (Po, Py) occur throughout the unit.

Bands of muscovite up to 4 cm occur but are uncommon throughout the unit.

Intercalacted mafic volcaniclastics from 16.23 to 16.60 m depth and 26.14 to 26.42 m depth. Brecciated interval of ankerite occurs from 35.65 to 36.04 m depth. The mafic unit 26.14 to 26.42 m appears to be high in muscovite with 1-3mm Pyrrhotite blebs concordant with the foliation .

<<Min: 15.9 - 40.82 4% Min: Pyrite>> Blebs and veinlets 1 to 7 mm wide and can be centimeters in length. Pyrrhotite becomes more abundant at 36.6 m depth and sulphide abundance gradually increases down the interval.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 35.64 - 36.04 50% Calcite-Ankerite 45 deg. >> Brecciated ankerite veins centimeter scale (up to 3 cm). Some veins appear to be concordant to mudstone laminations however most often indistinguishable due to deformation. Minor calcite (~5% of vein mode)

<<Struc: 17 - 17.22 Moderate-Strong Fault>> Fault gouge with 2mm brecciated mudstone clasts.

<<Struc: 18.17 - 18.22 Moderate-Strong Fault>> Fault gouge & broken mudstone clasts (up to 5 cm).

<<Struc: 19.27 - 19.67 Moderate Fault>> Fault zone with broken mudstone clasts and 1 cm interval of gouge.

<<Struc: 21.5 - 22.72 Moderate-Strong Fault>>

<<Struc: 28.6 - 28.74 Moderate Fault>>

<<Struc: 34.55 - 34.58 Weak Fault>> Fault in muscovite layer

<<Struc: 35.65 - 36.04 Weak-Moderate Fault>> Broken mudstone/ankerite fragments with minor fault gouge (~5% of fault zone). The first 15 cm of the interval is solidified/re-lithified fault breccia and from 35.80 to 36.04 is the reworking of the fault zone.

End of Hole @ 40.82

Local Northing:		Cemented?:	No	Core Storage Loc.:	KZK Camp	Drill Completed:	7/2/2017
Local Elev. (m):				Hole Completed?:	Abandoned	Purpose:	Hydro
Comments:						Parent Hole:	

K17-426 was drilled for geotechnical and hydrogeological characteristics for the Class B Storage Facility.
Geological units include intercalated mafic volcaniclastics and mudstones with an mafic flow unit in the upper portion of the sequence. Calcite overprint is present throughout the hole and silicification occurs at specific intervals.
Hole abandoned due to sheared drill rods and K17-426B drilled immediately adjacent.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0	0	0	PLND-LiDAR	Knight Piésold	7/2/2017		☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 6.22 OVBN Overburden

6.22 6.70 MAFt Undifferentiated mafic volcaniclastic

6.22 - 6.7: Pale olive-green mafic volcaniclastic with high Calcite abundance. Calcite blebs and veins to 5 mm present throughout unit. Speckled Biotite crystals up to 1 mm present throughout the unit. Calcite-chlorite dominated matrix.

<<Min: 6.22 - 28.9 1% Min: Pyrrhotite>> Can also be hosted in small calcite veins. Pyrite can also occur but Pyrrhotite is ~95% of sulphide abundance. In different lithological units the mode can vary from 0.1 to 4%.

<<Alt: 6.22 - 28.9 Moderate Calcite>> Banded and veins/globs that occur concordant or discordant to the foliation/lamination.

<<Vein: 6.55 - 28.9 5% Quartz-Carbonate 70 deg. >> Quartz-carbonate veins from 1 to 30 mm concordant with laminations in mudstone and weak foliations in mafic volcaniclastics. In the non-foliated mafic flow unit veins are a distinct orientation however don't follow structures in the lithology. Most veins are 1 to 3 mm wide and are commonly folded in silica-altered intervals.

<<Struc: 6.61 - 6.98 Weak-Moderate Fault>> Minor gouge

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

6.70 10.33 MAFw mafic volcanic flows

6.7 - 10.33: Mafic intrusion of high carbonate content. Calcite and Biotite crystals are equigranular at about 1 mm throughout the entirety of the interval. Upper & lower contacts are fractured however appear gradational.

<<Struc: 10.08 - 10.33 Weak Fault>> No gouge but fine-grained fragments

10.33 11.95 MAFt Undifferentiated mafic volcaniclastic

10.33 - 11.95: Tuffaceous mudstone with intercalated mafic volcaniclastics. High calcareous content, high silica in some intervals and varying amount of deformation (weak to high). Original fabrics are not well recognizable in intervals of high deformation and silicification. Calcite veins folded at ~1 cm wavelengths.

<<Alt: 10.33 - 11.5 Weak-Moderate Silicification>> Irregular siliceous globs surrounded by fine calcite.

<<Alt: 10.33 - 11.5 Weak-Moderate Muscovite>>

11.95 13.50 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

11.95 - 13.5: Mudstone with ~1 mm laminations and carbonate blebs/veins. Moderate oxidation on most of carbonate blebs/veins.

<<Struc: 13.06 - 13.18 Weak-Moderate Fault>> Minor gouge.

13.50 18.58 MAFt Undifferentiated mafic volcaniclastic

13.5 - 18.58: Mafic volcaniclastic with silicification (down to 17.55 m depth) and deformation. Chlorite and calcite in matrix as well as deformed calcite veins/blebs. Calcite is folded in some sections. In un-silicified interval the matrix is dominated by Chlorite and Calcite, and 1 mm calcite crystals occur.

<<Alt: 13.5 - 14.52 Moderate Silicification>> Irregular siliceous globs surrounded by fine calcite.

<<Struc: 15.14 - 15.2 Moderate Fault>> Abundant clay in fracture

18.58 20.73 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

18.58 - 20.73: Laminated mudstone with intercalated mafic volcaniclastics. High calcareous overprint and strong deformation in some intervals to which the original laminations are near indistinguishable. Calcareous content is typically irregular bands (from deformation).

<<Struc: 20.48 - 20.58 Weak Fault>> No gouge but abundant fine-grained fragments

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

20.73 21.65 MAFt Undifferentiated mafic volcaniclastic

20.73 - 21.65: Pale olive-green colour and weakly foliated with minimal deformation. 1 mm or less crystal calcite with calcite bands.

21.65 28.90 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

21.65 - 28.9: Laminated mudstone with intercalated mafic volcaniclastics (up to 15 cm) and relatively undeformed. High carbonaceous content that increases in intensity towards the bottom of the interval. Light-grey calcite bands concordant to laminations occur where there is no carbonaceous laminations. Elongated sulphide blebs no greater than 1 cm occur concordant with foliation and make up ~2% of the mode.

<<Struc: 24.86 - 24.96 Weak-Moderate Fault>> Small fracture with minor gouge

<<Struc: 25.28 - 25.29 Weak-Moderate Fault>> Very small fracture with gouge

End of Hole @ 28.9

Comments:						Parent Hole:	

K17-426B drilled immediately adjacent to K17-426 (abandoned) for geotechnical and hydrogeological characteristics for the proposed Class B Storage Facility.
The hole consists of intercalated mafic volcanics (volcaniclastics and flows) and mudstone. Silicification is present as localized or pervasive intervals.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0	0	0	PLND-LiDAR	Knight Piésold	7/3/2017		☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 6.92 OVBN Overburden

6.92 8.08 MAFw mafic volcanic flows

6.92 - 8.08: Medium grey unit with equigranular (~1mm) Biotite throughout the unit with calcite in groundmass and in stringy veins/blebs. Equivalent to upper MAFw unit in K17-426.

<<Min: 6.92 - 25.22 0.5% Min: Pyrrhotite>> Primarily Pyrrhotite with minor Pyrite (~5% of sulphides in interval).

<<Alt: 6.92 - 40.48 Moderate Calcite>> Bands concordant to lamination/foliation and veins concordant or discordant to lamination/foliation.

<<Vein: 6.92 - 40.48 3% Quartz-Carbonate 65 deg. >> Quartz-Calcite veins concordant with laminations & foliations. Vary in size from 1 cm to 1 mm and are often folded. Veins are larger & less abundant in the mafic volcaniclastics than the mudstone units. Stringy veinlets also occur that cross-cut laminations and foliation and comprise about 10% of the veins.

8.08 14.49 MAFt Undifferentiated mafic volcaniclastic

8.08 - 14.49: Pale olive-green mafic volcaniclastic unit with moderate to strong calcite alteration, with calcite and chlorite in groundmass. Speckled Biotite crystals ~1mm comprise of 0 to 25% of the mode in certain intervals. Silicification and calcite veining is also present in specific intervals at differing intensities.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 8.96 - 17.6 Moderate Silicification>> Localized concentrations of silicification throughout the mafic volcaniclastic unit. Silicified intervals are mixed with calcite. More pervasive silicification at intervals from 14.00 to 14.46 m depth as well as 16.39 to 17.60 m depth.

<<Alt: 9.21 - 14 Weak Muscovite>> Muscovite/Sericite

14.49 16.39 MAFw mafic volcanic flows

14.49 - 16.39: Pale olive-green mafic flow with equigranular biotite and calcite with chlorite + calcite dominated matrix. Biotite + calcite crystals ~1 mm.

16.39 19.64 MAFt Undifferentiated mafic volcaniclastic

16.39 - 19.64: Pale olive-green mafic volcaniclastic unit with moderate to strong calcite alteration, with calcite and chlorite in groundmass. In upper part of sequence from 16.39 m to 17.70 m depth strong calcite alteration and silicification is present and higher abundance of chlorite in groundmass. Biotite mode increases to ~20% over that interval. Over remaining depth to 19.64 m the unit has calcite alteration similar to other MAFt units.

19.64 22.48 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

19.64 - 22.48: Laminated mudstone with intercalations of MAFt <4 cm. Irregular calcite bands concordant with laminations.

22.48 25.22 MAFt Undifferentiated mafic volcaniclastic

22.48 - 25.22: Mafic volcaniclastics (pale olive-green colour) with intercalated mudstone < 9 cm. Irregular calcite bands & veins (some folded) are concordant or discordant with the weak foliation.

25.22 40.48 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

25.22 - 40.48: Package of dark grey laminated mudstone with calcite and siliceous bands & veins concordant or discordant to the laminations. Localized deformation occurs in which veins can be folded, and some discordant veins showing brittle deformation.

<<Min: 25.22 - 40.48 1% Min: Pyrite>> Primarily concentrated in quartz-calcite veins but also found hosted in lithology. Up to 1.5 cm in size.

<<Alt: 26.3 - 40.48 Weak Silicification>> Silicification into mudstone laminations.

End of Hole @ 40.48

Comments:						Parent Hole:	

K17-427 was drilled to study the geotechnical properties of the proposed open pit high-wall. Optical and acoustic televiewer surveys were completed in the borehole.
Overburden extended to 4.22 m. Throughout the entire hole a package of intercalated felsic volcanic, meta-pelites, and carbonaceous units occurs. Weak to moderate muscovite alteration occurs from 141 m to 152 m (EOH).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 10.70 OVBN Overburden

10.70 13.89 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

10.7 - 13.89: Dark grey laminated mudstone with abundant calcite bands and quartz-calcite veins (< 1 cm). Minor deformation is present throughout most of the interval in which laminations, bands and veins are weakly folded. Lower contact with mafic ash-tuff is gradational. Intercalation of mafic volcaniclastic unit from 12.25 to 12.37 m depth.

<<Min: 10.7 - 40.62 1% Min: Pyrrhotite>> Pyrrhotite disseminated uniformly over mudstone and mafic units. Also includes Pyrite + Pyrrhotite vein-hosted blebs which can comprise of up to 10% of a vein.

<<Alt: 10.7 - 40.62 Weak-Moderate Calcite>> Banded calcite concordant with laminations of the mudstone units and folations (if present) of the mafic units. Quartz-Calcite veins also present at various thicknesses (mm scale up to 15 cm).

<<Vein: 10.7 - 26.92 5% Quartz-Carbonate 70 deg. >> Vary in size from 1 mm to 15 cm and vary in calcite to quartz ratio (both extremes exist). Hosts sulphides in some occurrences. Some discordant veins exist.

<<Struc: 12.99 - 13 Moderate Foliation>> Calcite band in mudstone lamination.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

13.89 17.69 MAFta Mafic coarse grained to ash tuff

13.89 - 17.69: Medium-grey fine-grained mafic ash tuff with speckled biotite crystals (< 1 mm) comprising of 2% of the mode. Unfoliated and minor chlorite in matrix. Quartz-Calcite occurs in irregular veins orientated similarly to the bands in the mudstone unit.

<<Struc: 16.77 - 16.78 Moderate Foliation>>

17.69 21.12 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

17.69 - 21.12: Laminated mudstone with minor calcite bands & irregular quartz-calcite veins. Veins are 0.5 to 15 cm, concordant with the laminations and often deformed.

<<Struc: 19.45 - 19.54 Weak Fault>> Fault with broken fragments & minor gouge.

<<Struc: 19.57 - 19.58 Moderate Foliation>> Mudstone lamination

<<Struc: 19.98 - 21.06 Weak Fault>> Minor fault with gouge.

21.12 21.94 MAFta Mafic coarse grained to ash tuff

21.12 - 21.94: Interval of mafic ash tuff. Medium-grey with speckled Biotite (1 mm, 2% of mode), chlorite in matrix and irregular quartz-calcite veins.

21.94 23.15 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

21.94 - 23.15: Laminated mudstone with calcite bands and irregular quartz-calcite veins concordant with laminations. Abundant veining & strong deformation is present in the lowermost 20 cm.

<<Struc: 22.67 - 22.69 Moderate Foliation>>

23.15 27.61 MAFta Mafic coarse grained to ash tuff

23.15 - 27.61: Interval of mafic ash tuff. Medium-grey with speckled Biotite (1 mm, 2% of mode), chlorite in matrix and irregular quartz-calcite veins up to 10 cm. Lower contact contains a quartz-calcite-chlorite vein that is heavily fractured.

<<Alt: 27.48 - 27.9 Weak Chlorite>> Chlorite in Quartz-Calcite-Chlorite veins.

<<Vein: 26.92 - 28.51 20% Quarzt-Chlorite-Carbonate 60 deg. >> Massive Quartz-Chlorite-Carbonate (calcite) also containing sulphide blebs. Set of 5 massive veins over interval variably spaced apart (no greater than 38 cm).

<<Struc: 26.34 - 27.82 Weak-Moderate Fault>> Fault zone with areas of sections of broken fragments (some with gouge) separated by short intervals (no greater than 30 cm) of competent core.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

27.61 36.48 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

27.61 - 36.48: Laminated mudstone with quartz-calcite bands and irregular quartz-calcite veins concordant with laminations. Quartz-Chlorite-Pyrite-Calcite vein present at top of interval. The bands are predominantly silica, in contrast to the bands (in mudstone units) in the upper sections of the hole which were dominated by (or entirely) calcite.

<<Vein: 28.51 - 40.62 5% Quartz-Carbonate 65 deg. >> Vary in size from 1 mm to 5 cm and vary in calcite to quartz ratio (both extremes exist). Hosts sulphides in some occurrences. Some discordant veins exist.

<<Struc: 28.29 - 28.3 Weak Foliation>> Deformed lamination

<<Struc: 30.18 - 30.19 Weak-Moderate Foliation>> Calcite band concordant to mudstone lamination.

<<Struc: 30.7 - 30.83 Weak-Moderate Fault>> Minor fault with gouge.

<<Struc: 33.86 - 33.87 Moderate Foliation>>

<<Struc: 34.38 - 40.55 Moderate Fault>> Fault zone with multiple gouge-filled fractures and broken fragments. Intensity and gouge abundance varies for each individual fault.

<<Struc: 36 - 36.01 Weak-Moderate Foliation>> Mudstone lamination.

36.48 37.04 MAFt **Undifferentiated mafic volcaniclastic**

36.48 - 37.04: Pale green mafic volcaniclastic with 1 mm speckled biotite crystals (4% of mode) and chlorite in groundmass. Lower half of interval is muscovite-dominated interval. Faulting at upper and lower contacts with mudstone units.

<<Alt: 36.72 - 36.94 Moderate-Strong Muscovite>> Original fabrics & mineralogy of mafic volcaniclastic unit hard to distinguishable from strong overprint of muscovite + sericite.

37.04 39.44 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

37.04 - 39.44: Dark grey mudstone with deformed laminations and very low abundance of calcite in contrast to other mudstone units. Entirety of unit is heavily fractured.

39.44 40.62 MAFt **Undifferentiated mafic volcaniclastic**

39.44 - 40.62: Pale green mafic volcaniclastic with 1 mm speckled biotite crystals 10-20% of mode) and chlorite in groundmass. Abundance quartz-calcite veins throughout from 1 mm to 4 cm.

<<Struc: 40.11 - 40.12 Moderate Vein>> Quartz-Calcite vein concordant with foliation.

Local Northing:		Cemented?:	SP	Core Storage Loc.:	KZK Camp	Drill Completed:	7/6/2017
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Hydro
Comments:						Parent Hole:	

K17-429 was drilled to determine the geotechnical and hydrogeological characteristics for the proposed LGO Stockpile.
The hole encountered a thick package of (primarily) mafic volcaniclastics in the upper 30 m and mudstones for the bottom 6 m. Intense faulting is present at certain intervals between 16 m and 27 m depth.

Downhole Surveys:

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 6.08 OVBN Overburden

6.08 7.04 MAFt Undifferentiated mafic volcaniclastic

6.08 - 7.04: Olive-green mafic volcaniclastic. Speckled Biotite crystals 0.5 to 2 mm 5% of the mode. Abundant chlorite in groundmass and 5 mm calcite veins are present.

<<Alt: 6.08 - 36.08 Weak-Moderate Calcite>> Banded/veins of calcite throughout the hole. Intensity is variable throughout the hole but is present in all units.

<<Vein: 6.08 - 31.21 5% Quartz-Carbonate 60 deg. >> Veins are quartz + calcite concordant with laminations and foliations. Range in size from 1 mm to 2 cm. Can be locally deformed as well as discordant to laminations and foliations. Can occur as an even mode of calcite to quartz, can be predominately calcite, or predominately quartz.

7.04 8.93 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

7.04 - 8.93: Laminated mudstone with intercalated mafic volcaniclastics. Varies in carbonaceous content from very low to moderate. Intervals of Calcite bands & veins are present concordant to laminations.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 7.04 - 8.12 Moderate Muscovite>>

<<Struc: 8.56 - 8.86 Weak-Moderate Fault>>

8.93 23.64 MAFt Undifferentiated mafic volcaniclastic

8.93 - 23.64: Olive green mafic volcaniclastic package with very weak to moderate foliation and chlorite in the groundmass. Calcite veins + bands concordant to the foliation are present throughout the unit. Speckled biotite 1 to 2 mm comprises 2 to 15% of the mode in certain sections. Intensely faulted zone from 16.2 to 22.6 m depth.

<<Min: 15.1 - 34.87 0.1% Min: Pyrite>> Isolated veinlets 1-2 mm.

<<Struc: 9.08 - 10.14 Weak Fault>> Fracture zone into fragments, no gouge.

<<Struc: 12.69 - 12.7 Moderate Foliation>>

<<Struc: 14.63 - 14.98 Weak-Moderate Fault>>

<<Struc: 16.14 - 20.57 Moderate-Strong Fault>> Fault zone of intervals of intense faulting. Completely gouged at some faults with broken fragments surrounding. Largest distance between fracture zones (competent rock) is 50 cm.

<<Struc: 22.18 - 22.65 Strong Fault>>

<<Struc: 22.83 - 22.84 Weak-Moderate Foliation>>

<<Struc: 23.52 - 24.93 Moderate-Strong Fault>> Fault zone of intervals of intense faulting. Completely gouged at some faults with broken fragments surrounding No intervals of competent rock within fault zone.

23.64 24.08 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

23.64 - 24.08: Interval of strongly faulted mudstone with calcite bands.

24.08 29.21 MAFt Undifferentiated mafic volcaniclastic

24.08 - 29.21: Olive green mafic volcaniclastic, non-foliated to weakly foliated. Abundant calcite in groundmass & irregular veins, and 1 mm Ankerite present for 3% of the mode. 1 mm Biotite crystals are less abundant than previous MAFt interval and comprise 3% of the mode.

<<Struc: 25.45 - 25.9 Moderate Fault>> Heavily gouged

<<Struc: 26.04 - 26.18 Strong Fault>>

<<Struc: 26.51 - 26.84 Moderate Fault>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

29.21 36.08 MDS

Undifferentiated carbonaceous mudstone & tuffaceous mudstone

29.21 - 36.08: Laminated mudstone with variable carbonaceous content. Greater abundance of silica as irregular bands as well as two 8 cm quartz-calcite veins (95% quartz). High amount of fracturing (broken clasts with no gouge) and healed fractures with calcite throughout the unit.

<<Vein: 31.21 - 31.27 100% Quartz-Carbonate 70 deg. >> 95% Quartz

<<Vein: 31.27 - 32.57 7% Quartz-Carbonate>> Zone of fracture-filling calcite veins (up to 5 mm) discordant to foliation. Stockwork appearance.

<<Vein: 32.57 - 32.64 100% Quartz-Carbonate 70 deg. >> 95% Quartz

<<Vein: 32.64 - 36.08 3% Quartz-Carbonate 60 deg. >>

<<Struc: 31.05 - 31.06 Moderate Foliation>> Mudstone Lamination

<<Struc: 32.77 - 34.83 Weak Fault>> Zone of fragmented rock. No gouge.

End of Hole @ 36.08

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	7/9/2017
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
Comments:						Parent Hole:	

K17-430 was drilled to study the geotechnical properties of the proposed open pit high-wall. Optical and acoustic televiewer surveys were completed in the borehole, as well as packer testing above and below the largest fault zone.
Overburden extended to 7.7 m. Throughout the entire hole a package of intercalated felsic volcanic, meta-pelites, and mafic intrusives occurs. Weak to moderate muscovite alteration occurs from 164 m to 182 m (EOH), with a zone of moderate chlorite +/- cordierite and disseminated sulfide (OJ) from 172.2 to 175.5m.

Local Easting:		Stored?:	Yes	Claims Title	KZK	Drill Started:	7/11/2017
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	7/13/2017
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
						Parent Hole:	

Comments:

K17-424 was drilled to study the geotechnical properties of the proposed open pit high-wall. Packer testing was completed, however optical and acoustic surveys were cancelled due to hole cave-in during reaming and tripping out.
Overburden was encountered to 26.1 m depth. Aphanitic rhyolite occurs from 26.1 to 34.79 m, with OB style mineralization directly below from 34.79 to 37.17 m. In the footwall of the mineralization a mafic intrusive occurs to 41.09 m. Below the mafic intrusive intercalated volcaniclastic rhyolite and aphanitic rhyolite occur to 94.31 m. From 94.31 to 127.15 m a large zone with fault rock and intact wedges of volcaniclastic rhyolite (98-100.68 m) and mafic intrusive (112.83-122.82 m) occurs. Below the fault zone volcaniclastic rhyolite extends to the bottom of the hole (152 m).

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
Comments:						Parent Hole:	

K17-438 was drilled to study the geotechnical properties of the proposed open pit high-wall. Optical and acoustic televiewer surveys were completed in the borehole, as well as packer testing above and below the largest fault zone.
Overburden extends to 4.94 m. Intercalated felsic volcanics, metapelites, carbonaceous mudstones, and mafic intrusives occur throughout the hole, with significant fault-breccia zones from 66.8-75.3 m, 124.3-133.7 m, 136.45-137.72 m, 142.45-144.3 m, 148.8-149.3 m. Damage zones around these fault rocks extend well into the wallrock. No significant alteration or mineralization was encountered in K17-438.

11.60 38.20 RHYvl Lapilli tuff

11.6 - 38.2: Light grey, matrix-supported lapilli tuff. Groundmass has oxidized to a pale cream colour (after drilling?). Penetrative foliation and lineation defined by stretched clasts ~50 degrees TCA.

<<Vein: 25.35 - 25.65 20% Quartz-Carbonate 50 deg. >> Zone with qz-carbonate veining

38.20 39.90 PEL Equigranular biotite + calcite +/- quartz rock, typically with finely intercalated contacts

38.2 - 39.9: Dark brown-black, BI-QZ-CA schist. Well developed penetrative foliation ~60 degrees TCA.

<<Alt: 38.2 - 39.9 Moderate Calcite>>

39.90 45.70 RHYvx Quartz and/or feldspar crystal tuff

39.9 - 45.7: Light grey, matrix-to-clast-supported, lapilli tuff with disseminated fine to medium grained blue quartz phenocrysts. Penetrative foliation with lineation defined by elongated lapilli ~40 degrees TCA.

<<Alt: 39.9 - 66.8 Trace Calcite>>

45.70 66.80 RHYvl Lapilli tuff

45.7 - 66.8: Light grey, matrix-supported, lapilli tuff. Penetrative foliation with a lineation defined by the stretched lapilli ~25-40 degrees TCA.

<<Struc: 63.5 - 66.8 Weak Fault>> Damage zone around fault core

66.80 75.30 FLZ Fault Zone

66.8 - 75.3: Pebble to granular clast-supported fault breccia with clay-gouge matrix. Dominantly RHY clasts with minor MDS clasts.

<<Alt: 66.8 - 75.3 Weak Calcite>>

<<Struc: 66.8 - 71 Moderate-Strong Fault>> Fault gouge-breccia to highly broken rock

<<Struc: 71 - 77 Weak Fault>> Damage zone around fault core

75.30 76.70 PEL Equigranular biotite + calcite +/- quartz rock, typically with finely intercalated contacts

75.3 - 76.7: Dark brown-black, biotite-calcite schist. Penetrative foliation is subparallel to the core axis (~5-10 degrees TCA), unlike the up-hole foliation. Potentially wrapped from the faulting.

<<Alt: 75.3 - 76.7 Moderate Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

76.70 97.90 RHYv Undifferentiated Rhyolite volcaniclastic

76.7 - 97.9: Light grey-green, fine grained ash (?) matrix +/- round to stretched felsic clasts. Penetrative foliation is at a low angle TCA, weak lineation defined by the stretched clasts ~10 degrees TCA.

<<Alt: 76.7 - 131.64 Weak Calcite>>

<<Struc: 86 - 89 Weak-Moderate Fault>> Damage zone with minor gouge slip-surfaces

97.90 108.90 RHYva Coarse grained to ash tuff

97.9 - 108.9: light grey-green to brown, fine grained sericite-chlorite-biotite-calcite schist. Looks to be a mixture of felsic ash (?) and pelitic (?) materials. Well developed penetrative foliation ~30 degrees TCA.

<<Vein: 108.1 - 108.15 100% Quartz-Tourmaline 60 deg. >> QZ-TML vein

108.90 124.30 RHYv Undifferentiated Rhyolite volcaniclastic

108.9 - 124.3: Light grey, QZ-MU schist with minor blebs/clasts of felsic material. Penetrative foliation defined by sericite-quartz banding ~40 degrees TCA. Minor blebby pyrrhotite.

<<Struc: 123 - 124.3 Weak Fault>> Damage zone around fault core

124.30 133.70 FLZ Fault Zone

124.3 - 133.7: Polymictic, gouge-supported fault breccia with clasts ranging from granular to pebble size and RHY to MDS in composition.

<<Alt: 131.64 - 136.83 Moderate Calcite>>

<<Struc: 124.3 - 131.6 Strong Fault>> Gouge-supported fault breccia

<<Struc: 131.6 - 136.85 Weak Fault>> Damage zone around fault core

133.70 136.45 PEL Equigranular biotite + calcite +/- quartz rock, typically with finely intercalated contacts

133.7 - 136.45: Medium pale green, chlorite schist with disseminated biotite and wispy calcite. Penetrative foliation ~25 degrees TCA.

136.45 137.72 FLZ Fault Zone

136.45 - 137.72: Polymictic, gouge-supported fault breccia with clasts ranging from granular to pebble size and RHY to MDS in composition.

<<Alt: 136.83 - 191 Weak-Moderate Calcite>>

<<Struc: 136.85 - 137.72 Strong Fault>> Gouge-supported fault breccia

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

137.72 142.45 RHYvx Quartz and/or feldspar crystal tuff

137.72 - 142.45: Light grey, sericite-QZ-FD schist with medium to coarse grained quartz and feldspar phenocrysts. FD phenos are white, subhedral, and elongated. QZ phenos are blue and round. Anastomosing foliation and lineation defined by elongated FD ~25 degrees TCA. Highly fractured as part of a damage zone around brittle faulting.

<<Vein: 139 - 139.3 100% Quartz-Carbonate 40 deg. >> Massive qz-carb vein. Partially broken up into fault zone (older than fault).

<<Struc: 137.72 - 142.45 Weak Fault>> Damage zone around fault core

<<Struc: 142.25 - 144.3 Strong Fault>> Gouge-supported fault breccia

142.45 144.30 FLZ Fault Zone

142.45 - 144.3: Polymictic, gouge-supported fault breccia with clasts ranging from granular to pebble size and RHY to MDS in composition.

144.30 145.75 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

144.3 - 145.75: Black, carbonaceous groundmass with elongated CA clasts/lapilli (?). Penetrative foliation and lineation defined by clasts ~20 degrees TCA. Minor buckle folding near lower contact.

<<Struc: 144.3 - 148.8 Moderate Fault>> Damage zone around fault core

145.75 148.80 RHYvl Lapilli tuff

145.75 - 148.8: Light grey, matrix-supported lapilli tuff. Strong shear foliation and lineation defined by elongated lapilli ~25 degrees TCA. Within the damage zone around fault zone.

148.80 149.30 FLZ Fault Zone

148.8 - 149.3: Gouge-supported fault breccia. High core loss.

<<Struc: 148.8 - 149.3 Strong Fault>> Gouge-supported fault breccia

149.30 158.03 RHYvl Lapilli tuff

149.3 - 158.03: Light grey, matrix to clast-supported lapilli tuff. Well developed penetrative foliation and lineation defined by elongated lapilli ~5 degrees TCA.

<<Min: 149.3 - 174.2 1% Min: Pyrrhotite>>

<<Struc: 149.3 - 152 Weak Fault>> Damage zone around fault core

15.27 18.00 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

15.27 - 18: Black, carbonaceous/argillic slate/mudstone. Well developed penetrative foliation ~40 degrees TCA.

<<Alt: 15.27 - 49.6 Moderate Calcite>>

18.00 18.96 MAFt Undifferentiated mafic volcaniclastic

18 - 18.96: Medium green, well foliated, fine grained, mafic tuff. Abundant wavy to ptygmatic calcite veinlets. Well developed foliation ~40 degrees TCA.

18.96 24.00 MAFw mafic volcanic flows

18.96 - 24: Medium green, poorly foliated to massive, fine grained, chlorite-biotite-quartz basalt flow/dyke. Large massive quartz-carbonate veins cut through and below the unit.

<<Vein: 19.9 - 22.3 100% Quartz-Carbonate 55 deg. >> Massive quartz-carbonate vein with altered wallrock clasts within

24.00 32.75 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

24 - 32.75: Black, carbonaceous mudstone with local carbonaceous pebble clasts within. Well developed foliation ~40 degrees TCA.

<<Vein: 24 - 25.2 70% Quartz-Carbonate>> Massive quartz-carbonate vein with altered wallrock clasts within.

<<Vein: 27.9 - 28.8 90% Quartz-Carbonate>> Massive quartz-carbonate vein with altered wallrock clasts within

32.75 33.75 MAFw mafic volcanic flows

32.75 - 33.75: Green, poorly foliated, fine grained, biotite-calcite porphyroblastic, chlorite-biotite-calcite schist. Basalt flow/dyke? Poorly developed foliation ~40 degrees TCA.

<<Vein: 33.52 - 33.79 100% Quartz-Carbonate 70 deg. >> Massive quartz-carbonate vein with altered wallrock clasts within

33.75 40.50 WCK Wacke - sandstone with 15-75% clay matrix

33.75 - 40.5: Intercalated black and dark green, carbonaceous mudstone, fine grained siltstone, and medium-coarse grained wacke with carbonaceous groundmass. Well developed penetrative foliation ~35 degrees TCA.

<<Struc: 40.14 - 40.14 Moderate dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

40.50 49.60 SED Undifferentiated sedimentary rock

40.5 - 49.6: Green to black, poorly sorted, matrix-supported breccia. Possibly formed from a debris flow?

<<Struc: 42.95 - 42.95 Moderate dominant foliation>>

<<Struc: 45 - 45 Orientation Lock Angle>> Lock angle between orientation marks at 45 m and 48 m.

<<Struc: 45.82 - 45.82 Moderate dominant foliation>>

49.60 55.00 MAFw mafic volcanic flows

49.6 - 55: Medium green, fine grained, weakly foliated to massive, chloritic basalt with disseminated biotite (~5%) and wispy calcite and pyrite veinlets. Penetrative foliation ~45 degrees TCA.

<<Alt: 49.6 - 67.75 Weak Calcite>>

55.00 67.75 INT undifferentiated (granitic) intrusive rocks

55 - 67.75: Light green to grey, biotite porphyroblastic, fine grained felsic groundmass, dyke. Weakly developed foliation ~60 degrees TCA.

<<Vein: 66.9 - 67 100% Calcite>> Crushed calcite vein

<<Struc: 62.8 - 67 Weak Fault>> Broken/crushed rock with minor gouge.

67.75 69.00 MAFt Undifferentiated mafic volcaniclastic

67.75 - 69: Green, fine grained mafic tuff with minor disseminated biotite.

<<Alt: 67.75 - 69 Moderate Calcite>>

69.00 71.94 INT undifferentiated (granitic) intrusive rocks

69 - 71.94: Light green to grey, biotite porphyroblastic, fine grained felsic groundmass, dyke.

<<Alt: 69 - 71.94 Weak Calcite>>

71.94 72.80 MAFt Undifferentiated mafic volcaniclastic

71.94 - 72.8: Green, fine grained mafic tuff with minor disseminated biotite and wispy to banded calcite.

<<Alt: 71.94 - 72.8 Moderate Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

72.80 84.12 INT undifferentiated (granitic) intrusive rocks

72.8 - 84.12: Light green to grey, biotite porphyroblastic, fine grained felsic groundmass, dyke. Strong oxidation with minor disseminated magnetite.

<<Alt: 72.8 - 84.12 Weak Calcite>>

<<Vein: 81.65 - 82.85 100% Quartz-Carbonate 60 deg. >> Massive quartz-carbonate vein with altered wallrock clasts within.

<<Struc: 77.75 - 77.75 Moderate dominant foliation>>

84.12 98.95 MAFt Undifferentiated mafic volcaniclastic

84.12 - 98.95: Green, fine grained, chlorite-calcite schist with disseminated biotite. Chlorite composes majority of the groundmass. Calcite is in bands.

<<Alt: 84.12 - 120 Moderate Calcite>>

<<Vein: 87.8 - 87.9 90% Quartz-Carbonate 30 deg. >> Irregular quartz-carbonate veining

<<Vein: 97.6 - 101.8 20% Quartz-Carbonate 25 deg. >> Zone with irregular quartz-carbonate veining

<<Struc: 85.3 - 85.4 Weak Fault>>

<<Struc: 86.25 - 86.3 Weak Fault>>

<<Struc: 91.2 - 91.4 Weak-Moderate Fault>>

<<Struc: 98.75 - 98.75 Moderate dominant foliation>>

98.95 105.15 MAFw mafic volcanic flows

98.95 - 105.15: Green, massive to weakly foliated, chlorite-calcite +/- disseminated biotite schist.

105.15 114.35 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

105.15 - 114.35: Black to dark green, intercalated carbonaceous-calcite schist and chloritic mafic tuff.

<<Struc: 110.4 - 110.4 Moderate dominant foliation>>

<<Struc: 113.65 - 113.65 Moderate Bedding>>

114.35 120.00 MAFt Undifferentiated mafic volcaniclastic

114.35 - 120: Green, well foliated, fine grained, chlorite-calcite, mafic tuff/schist with disseminated ankerite porphyroblasts.

Local Easting:		Stored?:	Yes	Claims Title	KZK	Drill Started:	7/25/2017
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	7/27/2017
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
Comments:						Parent Hole:	

K17-440 was the last of nine holes drilled for the 2017 in-pit geotechnical program, and the second within the proposed Krakatoa pit.
Drilling intersected rhyolite volcaniclastic with several 1-8 m thick layers of coherent rhyolite occurring from the top to the bottom of the hole. Three 4-6 m wide pelite layers occur in the top half of the hole along with a minor amount of intrusive rhyolite. Several intervals of fault gouge occur between 73-122 m depth.
Weak syngenetic muscovite alteration occurs near the bottom of the hole. No significant mineralization was intersected.

<<Struc: 15.99 - 16 Weak-Moderate Foliation>> Mudstone lamination.

18.02 19.49 MAFta Mafic coarse grained to ash tuff

18.02 - 19.49: Fine-grained mafic ash tuff with chlorite in groundmass. Equigranular throughout the unit with Biotite crystals up to 0.5 mm, as well as Calcite veining throughout the unit (up to 1.5 cm). Intercalated mudstone of 15 cm in the centre of the interval.

19.49 22.92 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

19.49 - 22.92: Laminated mudstone with high calcite content (present in bands) and varying carbonaceous content. Quartz-calcite veins present (up to 6 cm) concordant with laminations and some are minorly deformed. Upper contact is sharp while lower contact is gradational.

<<Struc: 22 - 22.01 Weak-Moderate Foliation>> Mudstone Lamination

22.92 25.92 MAFta Mafic coarse grained to ash tuff

22.92 - 25.92: Unit of fine-grained equigranular mafic ash tuff with chloritic matrix. Structures aside from calcite banding that are concordant with a very weak foliation. Upper contact is gradational with mudstone while lower contact is a 25 cm quartz-calcite-chlorite vein (93% quartz).

<<Vein: 25.68 - 26.81 50% Quarzt-Chlorite-Carbonate>> Two massive veins (both 25 cm) intercalated with 55 cm of mudstone & mafic ash tuff. Both veins are predominantly quartz with minor calcite + chlorite components (~5% each).

<<Struc: 24.99 - 25 Trace Foliation>> Mafic ash tuff foliation

25.92 26.27 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

25.92 - 26.27: Laminated mudstone, weakly deformed and low carbonaceous content.

26.27 30.00 MAFta Mafic coarse grained to ash tuff

26.27 - 30: Fine-grained mafic ash tuff with chlorite in groundmass. Equigranular throughout the unit with abundant quartz-calcite veins up to 15 cm (20% of mode).

<<Vein: 26.81 - 40.19 6% Quartz-Carbonate 65 deg. >> Quartz-calcite veins with variable quartz to calcite ratios (both extremes exist). Primarily concordant with mudstone laminations or very weak foliations of the mafic ash tuff. Few massive veins (up to 12 cm) are present.

<<Struc: 27.06 - 27.07 Moderate Foliation>> Calcite band in mafic ash tuff

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

30.00 32.05 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

30 - 32.05: Laminated mudstone with calcite bands and large irregular (discordant to lamination) quartz-calcite veins. Deformation (folding) is localized throughout the unit.

<<Struc: 32.04 - 32.05 Moderate Foliation>> Calcite band concordant to mudstone lamination

32.05 32.77 MAFta **Mafic coarse grained to ash tuff**

32.05 - 32.77: Fine-grained mafic ash tuff with chlorite in groundmass. Irregular quartz veins (up to 9 cm) are abundant. Contains 5 cm intercalation of mudstone.

32.77 40.19 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

32.77 - 40.19: Laminated mudstone, 1 mm to 3 cm quartz-calcite veins. Localized deformation causing veins to have folding. Upper contact with mafic ash tuff is heavily fractured.

<<Struc: 37.02 - 37.03 Moderate Foliation>> Calcite band concordant to mudstone lamination

<<Struc: 38.2 - 38.21 Weak Foliation>> Mudstone lamination (minorly deformed).

0.00	**3.98**	**OVBN** **Overburden**									
3.98	**12.82**	**MDS** **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**									

3.98 - 12.82: Laminated mudstone with high calcareous content, occurring as bands/veins concordant to the laminations. Weak to weak-moderate deformation is present throughout the unit.

<<Min: 3.98 - 39.98 0.1% Min: Pyrite>>

<<Alt: 3.98 - 24.41 Moderate Calcite>> Bands and veins of calcite throughout all units.

<<Vein: 3.98 - 15.98 2% Quartz-Carbonate 60 deg. >> Quartz-Calcite veins concordant to mudstone laminations. Range from 1 mm to 15 mm in size. Some discordant veins are present.

<<Struc: 8.81 - 8.82 Moderate Foliation>> Mudstone lamination

<<Struc: 12.61 - 12.83 Weak Fault>> Fault at contact between mudstone and mafic unit. No gouge but heavily fractured.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

12.82 20.38 MAFt Undifferentiated mafic volcaniclastic

12.82 - 20.38: Mafic lapilli-tuff with intermixed graphitic layers. High calcareous content with abundant chlorite in groundmass. Lapilli are medium-grey clasts of calcite + chlorite. Lower contact is saw-toothed.

<<Alt: 12.83 - 14.48 Moderate-Strong Muscovite>> Gradational intensity, strong at the upper bound to patchy & moderate at the lower bound.

<<Struc: 14.48 - 17.48 Weak-Moderate Fault>> Fault zone with 20 cm gouged interval near 17 m depth.

<<Struc: 19.95 - 19.96 Moderate Foliation>> Foliation in mafic volcaniclastic.

			20.50	21.00	0.50						

20.38 25.19 MAFta Mafic coarse grained to ash tuff

20.38 - 25.19: Fine-grained medium-grey mafic ash tuff. With calcite + chlorite groundmass. Equigranular with crystals < 1 mm and contains abundant calcite. 20 cm Biotite-Chlorite-Calcite rich zone with Sphalerite at 20.75 m depth. Moderately to strongly altered to muscovite or silica from 24.43 to 25.19 m depth.

<<Min: 20.76 - 20.94 1% Min: Sphalerite>> Small band of sphalerite within zone of strong chlorite-biotite-calcite alteration

<<Alt: 20.76 - 20.94 Moderate-Strong Chlorite>> Narrow band of Chlorite with disseminated BI and minor diss SP

<<Alt: 20.76 - 20.94 Moderate Biotite>>

<<Alt: 24.41 - 24.77 Moderate-Strong Muscovite>>

<<Alt: 24.77 - 39.98 Weak-Moderate Silicification>>

<<Alt: 24.77 - 39.98 Moderate Calcite>>

<<Vein: 24.98 - 39.98 2% Quartz-Carbonate 60 deg. >> Quartz-Calcite veins concordant to mudstone laminations. Range from 1 mm to 40 mm in size. Some discordant veins are present.

<<Struc: 21.48 - 23.48 Weak-Moderate Fault>> Fault zone with abundant fractures & fragmented rock. Minor gouged zone in the centre of the fault zone.8

25.19 32.23 MAFt Undifferentiated mafic volcaniclastic

25.19 - 32.23: Mafic volcaniclastic unit with moderate calcite + silica alteration. Chlorite and calcite in groundmass and abundant calcite bands/veins. Most calcite veins are deformed and other original textures are modified from silica alteration.

<<Struc: 30.8 - 30.81 Moderate Foliation>> Foliation (calcite band) in mafic unit.

32.23 37.32 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

32.23 - 37.32: Laminated mudstone with strong calcite alteration and moderate to weak silica alteration.

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Hydro
						Parent Hole:	

Comments:

K17-443 was drilled for geotechnical and hydrogeological characteristics for the proposed upper water management pond. The hole encounters intercalated mafic volcaniclastic and mudstones, all of which is weakly to strongly altered to calcite.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0	0	0	PLND-LiDAR	Knight Piésold	8/3/2017		☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 8.50 OVBN Overburden

8.50 9.80 MAFt Undifferentiated mafic volcaniclastic

8.5 - 9.8: Pale green mafic volcaniclastic with chlorite and calcite in matrix. Pervasive calcite alteration throughout the interval makes original texture hard to distinguish. Quartz-Calcite veins (up to 1 cm) present concordant to a weak foliation, and the lower contact is a 7 cm quartz-calcite vein.

<<Alt: 8.5 - 28.97 Moderate Calcite>> Bands, veins, and in groundmass. Weak-Moderate to strong alteration throughout the interval and is weakest in the carbonaceous mudstone units.

<<Vein: 8.5 - 23.35 3% Quartz-Carbonate 75 deg. >> Concordant to mudstone laminations and weak foliation in mafic units. Primarily concordant however there are intervals (10-20 cm) of abundant discordant veins alongside the concordant veins. Larger veins can host sulphide (Pyrite or Pyrrhotite) mineralization. Vein abundance increases in the mudstone units.

9.80 10.67 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

9.8 - 10.67: Carbonaceous mudstone with calcite bands (up to 1 cm) & stringy quartz-calcite veins (mm scale).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 9.8 - 10.67 3% Min: Pyrrhotite>> 1 mm to 2 cm lenses or pods hosted in veins with carbonate. Pyrite accounts for 10% of the sulphides in the interval.

10.67 11.85 MAFt Undifferentiated mafic volcaniclastic

10.67 - 11.85: Mafic volcaniclastic with chlorite + calcite in groundmass. Calcite alteration makes original textures indistinguishable.

11.85 12.80 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

11.85 - 12.8: Laminated mudstone with minor carbonaceous component and pervasive calcite alteration.

12.80 13.38 MAFt Undifferentiated mafic volcaniclastic

12.8 - 13.38: Mafic volcaniclastic with chlorite + calcite in groundmass. A few minor quartz-carbonate veins (mm scale) are concordant to the weak foliation.

13.38 15.57 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

13.38 - 15.57: Laminated mudstone, moderately carbonaceous with calcite banding (alteration) and quartz-calcite veins discordant to laminations.

<<Min: 13.54 - 28.97 0.1% Min: Pyrite>> 1 mm to 2 cm lenses or aggregates (in larger veins) hosted in veins with carbonate. Most abundant in mudstone units.

<<Struc: 15.4 - 15.52 Weak Fault>> Fault with small fragments (1 cm to <1 mm), no gouge.

15.57 16.92 MAFt Undifferentiated mafic volcaniclastic

15.57 - 16.92: Mafic volcaniclastic unit with chlorite + calcite groundmass. Irregular quartz-calcite-(pyrite) veins are abundant and account for ~20% of the mode

16.92 20.46 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

16.92 - 20.46: Mudstone, Laminated and massive with abundant calcite banding & quartz-calcite-(pyrite) veins. Intercalated chloritic (mafic volcaniclastic) unit up to 10 cm.

<<Struc: 19.46 - 19.47 Moderate Vein>> Quartz-Carbonate vein concordant to mudstone lamination.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

20.46 22.00 MAFt Undifferentiated mafic volcaniclastic

20.46 - 22: Mafic volcaniclastic with chlorite + calcite groundmass. Irregular stringy quartz-calcite veins.

22.00 28.97 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

22 - 28.97: Laminated mudstone with high calcareous content in the form of bands + veins (concordant + discordant). Massive quartz-calcite vein from 23.35 to 23.75 m depth.

<<Vein: 23.55 - 23.75 98% Quartz-Carbonate>> Massive vein in mudstone unit. 65% Quartz 35% Calcite.

<<Vein: 23.75 - 38.5 3% Quartz-Carbonate 75 deg. >> Continuation of regular-sized (2-50 mm) concordant vein set that occurs throughout the hole. Increase in abundance in the mudstone units. Stringy discordant veins also occur but account for small proportion of the veins (~5%).

28.97 38.50 MAFt Undifferentiated mafic volcaniclastic

28.97 - 38.5: Package of mafic volcaniclastic with varying texture, chlorite content, and calcite content. Calcite alteration is intense at bottom 2 meters of the interval destroying any previous textures/structures. Intervals of lapilli tuff with calcite lapilli present from ~ 31 m to 34.3 m.

<<Alt: 28.97 - 32.26 Moderate-Strong Calcite>> Calcite-dominated groundmass and in clasts/lapilli of mafic volcaniclastics.

<<Alt: 32.26 - 38.5 Strong Calcite>> Nearly 100% calcite, Original structures hard to distinguish. Quartz-calcite veins present (irregularly orientated).

End of Hole @ 38.5

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Hydro
						Parent Hole:	

Comments:

K17-444 was drilled for geotechnical and hydrogeological characteristics for the proposed upper water management pond.
The hole encounters mafic volcaniclastics of varying texture and mineralogy with an intercalation of mudstone from ~16 m to 20 m depth.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0	0	0	PLND-LiDAR	Knight Piésold	8/5/2017		☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
0.00	**12.47**	**OVBN** **Overburden**									
12.47	**15.95**	**MAFt** **Undifferentiated mafic volcaniclastic**									

12.47 - 15.95: Olive green mafic volcaniclastic with intercalated mudstone. Chlorite and calcite in groundmass with coarse biotite (up to 1.5 mm) accounting for 2% of the mode.

<<Alt: 12.47 - 43.97 Weak-Moderate Calcite>> Calcite banding present in all units throughout the hole. Intensity varies from weak to strong, whereas the weak alteration is typically found in the highly carbonaceous mudstones and highly chloritic mafic. The strong alteration is uncommon but can be found in mafic volcaniclastics.

<<Vein: 12.47 - 25.14 1% Quartz-Carbonate 70 deg. >> Quartz-Calcite veins 1 to 15 mm and concordant to mudstone laminations and weak foliations in the mafic volcaniclastics.

<<Struc: 14.85 - 15.16 Weak Fault>> Fault zone with minor gouge.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

15.95 19.88 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

15.95 - 19.88: Dark grey to black laminated mudstone with carbonaceous and micaceous laminations. No calcareous content except for quartz-calcite veins (up to 5 mm) concordant to laminations. Sharp contacts with upper & lower mafic volcaniclastics.

<<Min: 18.6 - 18.75 3% Min: Pyrite>> Discordant pyrite vein (3 mm)

<<Struc: 16.79 - 16.89 Weak Fault>> Fragmented, no gouge

<<Struc: 17 - 17.01 Weak-Moderate Foliation>> Mudstone lamination

19.88 43.97 MAFt **Undifferentiated mafic volcaniclastic**

19.88 - 43.97: Package of mafic volcaniclastics with variable textures and compositions. Invariably the package contains chlorite in groundmass, calcite in groundmass and/or in veins, as well as coarse biotite (up to 2 mm) as porphyroblasts. The biotite ranges from 1% to 40% of the mode at certain intervals. Abundant quartz-calcite veining from 1 mm to 24 cm, and massive veins also contain chlorite (massive appearance).

<<Min: 19.88 - 43.97 0.5% Min: Pyrrhotite>> Disseminated Pyrrhotite throughout lower MAFt unit. Certain intervals near 33 m depth can reach up to 3% of the mode.

<<Vein: 25.14 - 27.11 10% Quarzt-Chlorite-Carbonate>> Interval with 3 massive quartz-calcite-chlorite veins 8 to 24 cm spaced up to 1.3 m apart. Chlorite accounts for < 10% of the mode while quartz is ~60% and calcite ~30%.

<<Vein: 27.11 - 43.97 5% Quartz-Carbonate 70 deg. >> Quartz-Calcite veins concordant to weak foliations in the mafic volcaniclastics.

<<Struc: 21.05 - 21.41 Weak-Moderate Fault>> Fault zone, multiple fracture planes with gouge.

<<Struc: 26.48 - 26.6 Weak-Moderate Fault>> Fault zone with gouge.

<<Struc: 27.06 - 27.11 Weak-Moderate Fault>> Fault with gouge.

<<Struc: 28.03 - 28.9 Moderate Fault>> Fault zone with multiple gouged fault planes.

<<Struc: 30.23 - 30.27 Weak Fault>> No fault gouge.

End of Hole @ 43.97

0.00 11.12 OVBN Overburden

11.12 19.37 MAFt Undifferentiated mafic volcaniclastic

11.12 - 19.37: Light grey to pale green mafic volcaniclastic with intercalated mudstone. Chlorite in groundmass in pale green sections while medium grey sections are higher in calcite (banded or in groundmass). Speckled biotite ~1 mm accounts for 5% of the mode.

<<Min: 11.12 - 23.35 0.1% Min: Pyrrhotite>>

<<Alt: 11.12 - 28.54 Weak Calcite>> Calcite bands throughout all units, and in matrix of mafic units.

<<Vein: 11.12 - 22.18 3% Quartz-Carbonate 55 deg. >>

<<Struc: 15.02 - 15.43 Trace Fault>> Small fault with broken fragments

<<Struc: 15.59 - 15.6 Weak Foliation>> Foliation in mafic volcaniclastic

19.37 20.12 MDSc Carbonaceous dominant mudstone

19.37 - 20.12: Black mudstone with calcite bands and quartz-calcite veins. Upper & lower contacts with mafic units are sharp.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 19.44 - 19.45 Weak Foliation>> Graphitic lamination

20.12 23.95 MAFt Undifferentiated mafic volcaniclastic

20.12 - 23.95: Fine-grained medium grey mafic volcaniclastic. +Chlorite in groundmass and biotite crystals 1 to 2 mm accounting for 3% of the mode. Upper contact transitions to an intermixed mafic and mudstone unit.

<<Vein: 22.18 - 22.79 80% Quartz-Carbonate>> Massive quartz-calcite vein with intermixed MAFt. Pyrite + Pyrrhotite mineralization present within the vein.

<<Vein: 22.79 - 28.39 3% Quartz-Carbonate 60 deg. >> 1 mm to 2 cm in size.

23.95 28.54 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

23.95 - 28.54: Black laminated mudstone with intercalated mafic volcaniclastic. Heavily fractured at upper contact, lower contact is massive quartz vein.

<<Vein: 28.39 - 28.5 90% Quartz-Carbonate>> Massive vein near chert contact.

<<Struc: 23.95 - 24.54 Weak Fault>> Fault with minor gouge, small (< 10 mm) fragments.

<<Struc: 27.65 - 27.66 Moderate Foliation>> Mudstone lamination

28.54 30.62 CHT Chert

28.54 - 30.62: Dark grey fine-grained equigranular unit with a siliceous groundmass. Very competent and unfoliated. Irregular quartz-calcite veins 1 to 50 mm present throughout.

<<Vein: 28.54 - 30.62 5% Quartz-Carbonate>> Discordant veins in chert unit. Larger than quartz-calcite veins found in mafic and mudstone units. From 1 mm to 6 cm.

30.62 31.92 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

30.62 - 31.92: Black to dark grey laminated mudstone. Abundant quartz-calcite veins irregular but concordant with laminations. 7 cm interval of the chert at 31.31 m depth in which the contact with the mudstone is sharp, and the mudstone adjacent to the contact is highly graphitic & very low in quartz-calcite.

<<Alt: 30.62 - 32.75 Weak Calcite>> Calcite bands in mudstone, banded & in groundmass of mafic units.

<<Vein: 30.62 - 32.75 5% Quartz-Carbonate 60 deg. >>

31.92 32.75 MAFt Undifferentiated mafic volcaniclastic

31.92 - 32.75: Pale green mafic volcaniclastic. Chlorite in matrix with 1 mm calcite and biotite crystals. Quartz-calcite veins concordant with a weak foliation.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 32.03 - 32.04 Moderate Foliation>> QC Vein concordant to foliation in mafic volcaniclastic.

32.75 39.88 MDSc Carbonaceous dominant mudstone

32.75 - 39.88: Laminated carbonaceous mudstone with siliceous clasts elongated & concordant with laminations. Very weakly calcareous.

<<Min: 32.75 - 41.12 1% Min: Pyrrhotite>>

<<Vein: 32.75 - 39.88 1% Quartz 45 deg. >>

39.88 41.12 MAFt Undifferentiated mafic volcaniclastic

39.88 - 41.12: Pale green to medium grey mafic volcaniclastic with a weak-moderate foliation. Pale green sections are chlorite-dominated (groundmass) while medium grey sections are calcite-dominated (banded). Speckled biotite 1 mm accounts for 2% of the mode.

<<Alt: 39.88 - 41.12 Weak-Moderate Calcite>> Bands & groundmass. Calcite alteration intensity increases in the bottom 75 cm of the hole and some bands are deformed.

<<Vein: 39.88 - 41.12 5% Quartz-Carbonate 60 deg. >>

<<Struc: 40.21 - 40.22 Weak Foliation>> Foliation (calcite) in mafic volcaniclastic.

End of Hole @ 41.12

Comments:

K17-446 was drilled to test the geotechnical and hydrogeological characteristics at the site of the proposed upper water management pond. The hole encounters intercalated mudstones and mafic volcaniclastics from the Wind Lake Formation.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0	0	0	PLND-LiDAR	Knight Piésold	8/11/2017		☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 9.66 OVBN Overburden

9.66 11.92 MAFt Undifferentiated mafic volcaniclastic

9.66 - 11.92: Medium grey to pale green mafic volcaniclastic. Speckled biotite crystals 1 mm accounts for 5% of the mode (low abundance and high abundance sections are present).

<<Min: 9.66 - 15.83 0.1% Min: Pyrrhotite>>

<<Alt: 9.66 - 39.66 Weak Calcite>> Calcite in groundmass, quartz-veins, and dominantly in bands that are present in all units. Intensity varies from very weak to moderate. In general the mudstones have less calcite alteration than the mafic volcaniclastics.

<<Vein: 9.66 - 39.66 4% Quartz-Carbonate 70 deg. >> Concordant with laminations in mudstone units and foliations in mafic volcaniclastics. 1 mm to 6 cm in size.

11.92 14.16 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

11.92 - 14.16: Laminated mudstone with graphitic layers and intercalated mafic volcaniclastics. Mafic intercalations are pale green (chlorite groundmass) and contain 1 mm biotite crystals.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

14.16 15.83 MAFt Undifferentiated mafic volcaniclastic

14.16 - 15.83: Pale green mafic volcaniclastic with 1 mm biotite crystals. Upper & lower contacts with mudstones are gradational.

15.83 24.17 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

15.83 - 24.17: Dark grey to black mudstone with intercalated mafic volcaniclastic layers. Graphitic laminations are present but minor relative to laminations in most of the MDS in the Wind Lake Formation. Mafic layers are pale green (chlorite groundmass) with speckled biotite. Pyrrhotite is abundant from ~18 m depth to the bottom of the interval.

<<Min: 15.83 - 27.94 3% Min: Pyrrhotite>> Interval of abundant Pyrrhotite in mudstone. In certain sections the mode can reach up to 7%.

<<Struc: 16 - 16.01 Moderate Foliation>> Mudstone lamination

<<Struc: 24 - 24.01 Moderate Foliation>> Mudstone lamination.

24.17 26.58 MAFt Undifferentiated mafic volcaniclastic

24.17 - 26.58: Medium-grey to pale green mafic volcaniclastic. Chlorite in groundmass with speckled biotite crystals ~1 mm. Elongated clasts of Calcite concordant with the foliation are present at 25.05 m depth and vary in size.

<<Struc: 25.81 - 26.58 Weak Fault>> Re-worked fault (lithified breccia present) with gouge and small fragments.

26.58 27.94 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

26.58 - 27.94: Dark grey to black mudstone with minor graphitic laminations and intercalated mafic volcaniclastics (chloritic layers).

<<Struc: 26.95 - 26.96 Moderate Foliation>> Quartz-calcite vein concordant to mafic volcaniclastic foliation.

27.94 39.66 MAFt Undifferentiated mafic volcaniclastic

27.94 - 39.66: Medium grey to pale green mafic volcaniclastics. Chlorite in groundmass varies as indicated by the rock colour (green indicates chlorite). Highly calcareous in certain sections in groundmass, bands, and/or quartz-calcite veins. Weak to moderate foliation with concordant quartz-calcite veins.

<<Min: 27.94 - 39.66 0.1% Min: Pyrrhotite>>

<<Alt: 38.55 - 38.59 Weak Chlorite>> Chlorite in quartz-calcite vein with coarse biotite envelope.

<<Struc: 28.96 - 29.13 Trace Fault>> Fault with multiple gouged planes.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
<<Struc: 31.72 - 31.89 Trace Fault>> Fault with multiple gouged planes.											
<<Struc: 32.66 - 32.95 Trace Fault>> Fault with multiple gouged planes.											
<<Struc: 35.02 - 35.03 Moderate Foliation>> Calcite band concordant to mafic volcaniclastic foliation.											
End of Hole @ 39.66

Local Northing:		Cemented?:	No	Core Storage Loc.:	KZK Camp	Drill Completed:	8/25/2017
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Exploration
						Parent Hole:	

Comments:

K17-447 was drilled as a condemnation/exploration drill hole below the pit rim pond. The casing was left in and the hole was lined with PVC pipe for a DHEM survey.
Intercalated mudstones and mafic tuffs of the Wind Lake Formation occur from 10.1 (below overburden) to 130.83 m. Within this formation a small zone of semi-massive pyrrhotite + chalcopyrite occurs from 50.12 to 51.29 m, which lies at a similar horizon as weak alteration in hole K15-333. K17-447 also lies on the edge of a VTEM high.
Below the Wind Lake Formation a package of intercalated quartz +/- feldspar crystal tuffs and mudstones occurs to 234.58 m. Below this a mudstone dominated package with minor intercalated conglomerates and intermediate to felsic tuffs occurs to a depth of 311.01 m. From 311.01 to 368.89 m felsic dominated volcanics occur. The lowest package within K17-447 (368.89 to 452 m) is composed of intercalated mudstones, conglomerates, and mafic tuffs, similar to the Wind Lake Formation.
A narrow muscovite alteration zone associated with blebby pyrrhotite + chalcopyrite occurs from 421.85 to 422.29 m.

From (m)	To (m)	Rocktype & Description
0.00	**10.10**	**OVBN** **Overburden**
10.10	**16.80**	**MDSc** **Carbonaceous dominant mudstone**

10.1 - 16.8: Intercalated, black carbonaceous mudstone and light green mafic ash tuff. MAFt units locally have disseminated BI porphyroblasts. Individual layers vary from millimeters to tens of centimeters thick.

<<Min: 10.1 - 21 1% Min: Pyrrhotite>>

<<Alt: 10.1 - 50.12 Weak-Moderate Calcite>>

<<Vein: 10.1 - 73.5 3% Quartz-Carbonate 70 deg. >> Spaced irregular calcite +/- quartz veins and vienlets

From (m)	To (m)	Rocktype & Description
16.80	**50.12**	**MAFt** **Undifferentiated mafic volcaniclastic**

16.8 - 50.12: Medium green, chlorite-biotite-calcite schist. Biotite occurs as disseminated porphyroblasts throughout with zones of stronger intensity, including near the lower contact with semi-massive sulfides. Chlorite occurs as a fine grained groundmass throughout. Calcite occurs mainly as bands and patches throughout. Local laminations with intercalated fine grained ash tuff and BI-rich tuff occurs. From 26.8-39.2 m patches of bleaching (clay-sericite?) occur, which are spatially related to narrow quartz-carbonate veins and fracture zones.

<<Min: 21 - 22.8 1% Min: Sphalerite>>

<<Min: 21 - 22.8 3% Min: Pyrrhotite>>

<<Min: 21 - 22.8 1% Min: Galena>>

<<Min: 22.8 - 50.12 1% Min: Pyrrhotite>>

<<Alt: 26.8 - 39.2 Weak-Moderate Muscovite>> Local zones of intense QSP alteration around veining and fracture networks. Away from these zones the BI-porphyroblasts are selectively replaced. Gives a bleached appearance.

From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 91.46 - 91.46 Weak-Moderate dominant foliation>>

98.80 118.40 MDSc Carbonaceous dominant mudstone

98.8 - 118.4: Black, well laminated, carbonaceous mudstone with bands/veinlets of calcite throughout. Local patchy PY+PO occurs. Moderate amount of faulting throughout.

<<Min: 98.8 - 130.83 2% Min: Pyrrhotite>>

<<Struc: 105.4 - 106.7 Moderate Fault>>

<<Struc: 108.45 - 110 Moderate Fault>>

<<Struc: 114.3 - 118 Weak-Moderate Fault>>

118.40 119.67 MAFt Undifferentiated mafic volcaniclastic

118.4 - 119.67: Medium-olive green, fine grained, chlorite-calcite schist/mafic tuff.

119.67 121.40 MDSc Carbonaceous dominant mudstone

119.67 - 121.4: Black, carbonaceous mudstone to fine sandstone.

<<Struc: 120.2 - 120.7 Moderate Fault>>

121.40 122.60 MAFt Undifferentiated mafic volcaniclastic

121.4 - 122.6: Medium-olive green, fine grained, chlorite-calcite schist/mafic tuff.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

122.60 130.83 MDSc Carbonaceous dominant mudstone

122.6 - 130.83: Black, laminated, carbonaceous mudstone with calcite veinlets and patchy PY+PO. Green, fine grained, mafic tuffs occur from 123.88-124.06 m and 134.38-124.58 m. Lower contact has strong quartz-carbonate veining with RHYvx of the KZK formation in the footwall.

<<Vein: 130.7 - 132 20% Quartz-Carbonate 75 deg. >> Massive quartz-carbonate veining along Wind Lake-KZK contact

<<Struc: 127.81 - 127.81 Strong dominant foliation>>

<<Struc: 130.32 - 130.32 Moderate dominant foliation>>

130.83 140.83 RHYvx Quartz and/or feldspar crystal tuff

130.83 - 140.83: Medium-dark grey, quartz-feldspar crystal tuff/wacke. Quartz occurs as fine to medium grained round blue crystals (~15%). Feldspar occurs as white, fine to medium grained subhedral crystals (~20%). Fine grained quartz-muscovite-rich groundmass Local clasts of carbonaceous mudstone occur. Local bands of crystal deficient ash tuff (~5-10 cm thick) occur. The lower contact is gradational into a feldspar-poor/quartz-rich crystal tuff.

<<Min: 130.83 - 149 0.5% Min: Pyrrhotite>>

<<Alt: 130.83 - 140.83 Weak-Moderate Calcite>>

<<Vein: 137.58 - 137.64 100% Quartz-Carbonate 45 deg. >> Quartz vein in a fault zone

<<Struc: 133.69 - 133.69 Weak-Moderate dominant foliation>>

<<Struc: 136.67 - 136.67 Weak-Moderate dominant foliation>>

<<Struc: 137.55 - 137.7 Moderate Fault>>

<<Struc: 139.75 - 139.75 Weak dominant foliation>>

140.83 147.25 RHYvx Quartz and/or feldspar crystal tuff

140.83 - 147.25: Light yellowish-grey, blue round quartz phyric crystal tuff. Gradational with feldspar-rich unit above. Weak MU-alteration of the groundmass. Lower contact is faulted with RHYc.

<<Alt: 140.83 - 149 Weak Muscovite>> Yellowish Mu-alteration?

<<Alt: 140.83 - 153.57 Weak Calcite>>

<<Struc: 141.9 - 142.7 Strong Fault>>

147.25 149.00 RHYc Undifferentiated coherant rhyolite

147.25 - 149: Silicic banded rhyolite with weak yellowish MU altered cleavages. Upper contact is faulted. Lower contact is sharp with MDSc.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 147.25 - 149 1% Min: Galena>>

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	8/27/2017
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	9/15/2017
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Exploration
						Parent Hole:	

Comments:

K17-448 was drilled for Exploration/Condemnation over the proposed mill site. Hole shutdown on September 15th, 2017 at 7:00 am and was followed by a downhole EM survey.

- The top of the hole consists of carbonaceous-graphitic mudstone (slate) and chloritic-calcareous-fine to medium grain sediments and mafic flows (Wind Lake Formation).
- Core from 300.77m to 363.71m consists of felsic, porphyritic, volcaniclastic rhyolite (possibly intrusive? RHYcf/RHYif) and a biotite-rich interval, interpreted as meta-pelite (KZK Formation?).
- Core from 363.71m to 782.03 consists of intercalated, carbonaceous mudstone (MDS) and sediments (SED).
- From 782.3 to 827.18 m, a felsic porphyritic (or porphyroblastic) volcaniclastic sequence is encountered, which could also potentially be a felsic intrusion.
- From 782.02m to 1017.00m, sediments and mafic flows are dominantly, resembling the Wind Lake Fm, are encountered.

No significant muscovite or chlorite alteration similar to ABM deposit have been recognized. Biotite is observed all along the hole with different forms (fine grained to porphyroblastic, disseminated to patchy, as well as in veinlets). Mineralization consists of in wispy to fine grained disseminated pyrite, wispy to patchy pyrrhotite and locally trace chalcopyrite associated with pyrrhotite. Some evidence of post deformation mineralization is observed: including crosscutting pyrite veinlets and pyrite in pressure shadows.
The EM survey resulted in a positive conductivity anomaly as a result of graphitic mudstone, which was tested on core (using a multimeter). Originally planned at 900 metres, K17-448 was shut down at 1017 metres (E.O.H.) in mafic granular unit (possibly intrusive).

0.00 13.50 OVBN Overburden

0 - 13.5: Casing, rubbles.

13.50 35.63 MAFt Undifferentiated mafic volcaniclastic

13.5 - 35.63: Medium grey to pale green mafic volcaniclastic with variable composition and textures. Invariably has chlorite in groundmass (from minor to chlorite-dominated) as well as varying abundance of calcite (up to 50%) and speckled biotite crystals ~1 mm (up to 80%). Weakly foliated.

<<Min: 13.5 - 38.1 0.1% Min: Pyrrhotite>>

<<Min: 26.99 - 27 5% Min: Sphalerite>>

<<Alt: 13.5 - 62.66 Weak Calcite>> Calcite in bands and groundmass throughout all units. Pervasiveness is variable from trace to weak-moderate throughout the interval and both extremes exist in the mudstone and mafic.

<<Alt: 25.77 - 25.81 Moderate Muscovite>>

<<Vein: 13.5 - 266.7 3% Quartz-Carbonate>> Quartz-Calcite veins up to 7 cm concordant with mudstone laminations and mafic volcaniclastic foliations. Irregular (discordant) veins also occur but are not as common. Some larger veins contain chlorite. Vein abundance in given sections can range from ~10% to <1% of the mode.

<<Vein: 17.44 - 17.92 100% Quarzt-Chlorite-Carbonate>>

<<Vein: 20.35 - 20.75 95% Quarzt-Chlorite-Carbonate>> Dominantly calcite (~85%)

<<Vein: 22.91 - 23.17 100% Quarzt-Chlorite-Carbonate 75 deg. >> Minor tourmaline (<1%).

<<Vein: 24.3 - 24.43 97% Quartz-Carbonate>> Minor tourmaline (1%)

<<Vein: 24.85 - 25.77 95% Quarzt-Chlorite-Carbonate>> Quartz-Calcite dominated with 3% chlorite.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 27.48 - 27.49 Weak Foliation>>

<<Struc: 31.29 - 31.3 Weak-Moderate Foliation>>

35.63 36.42 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

35.63 - 36.42: Dark grey laminated mudstone with graphitic and calcareous layers. Upper and lower contacts with mafic volcaniclastics are gradational.

36.42 37.45 MAFt Undifferentiated mafic volcaniclastic

36.42 - 37.45: Intercalation of mafic volcaniclastics. Minor chlorite in groundmass and 1 mm biotite crystals 2% of the mode.

37.45 38.31 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

37.45 - 38.31: Dark grey laminated mudstone, dominated by graphitic layers but also includes calcareous layers. Two parallel (concordant with laminations) Sphalerite bands present ~0.5 cm at ~38 m depth.

<<Min: 38.08 - 38.1 20% Min: Sphalerite>> Minor pyrite (1%) and potentially galena with a similar mode to sphalerite (crystals too small to distinguish).

<<Min: 38.1 - 62.66 0.1% Min: Pyrrhotite>> Some sections contain up to 2% pyrrhotite

<<Struc: 37.93 - 37.94 Moderate Foliation>> Calcite band

38.31 44.89 MAFt Undifferentiated mafic volcaniclastic

38.31 - 44.89: Mafic volcaniclastic with chlorite in groundmass and banded calcite. Weak to moderately foliated and contains 1 mm biotite crystals throughout (1% of mode). Concordant and discordant Quartz-Calcite (larger ones also contain chlorite) veins are present up to 80 cm.

<<Vein: 38.31 - 39.18 99% Quarzt-Chlorite-Carbonate>> Quartz-Calcite dominated with 7% chlorite.

44.89 47.00 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

44.89 - 47: Dark grey laminated mudstone with abundant graphitic laminations. Contains calcite bands (up to 1 cm) concordant to laminations.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

47.00 47.62 MAFt Undifferentiated mafic volcaniclastic

47 - 47.62: Fine-grained mafic volcaniclastic with chlorite in matrix. Large quartz-calcite veins in unit (up to 12 cm). Sharp contacts with upper & lower mudstone units.

47.62 49.25 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

47.62 - 49.25: Dark grey laminated mudstone with intercalated mafic tuff. Calcite bands (up to 1 cm) present, concordant with laminations. Upper contact is sharp while lower contact is gradational.

49.25 58.50 MAFt Undifferentiated mafic volcaniclastic

49.25 - 58.5: Medium grey-pale green mafic volcaniclastic with chlorite in groundmass. Calcite occurs in bands and in groundmass as well as quartz-calcite veins (up to 1 cm) concordant to the weak foliation. Speckled biotite =< 1 mm accounts for 1% of the mode.

<<Struc: 55.87 - 55.88 Trace Foliation>>

<<Struc: 57.47 - 59.4 Weak Fault>> Fault with heavily gouged zone surrounded by highly fracture rock. Contains MAFt - MDS contact.

58.50 60.32 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

58.5 - 60.32: Dark grey laminated mudstone. Abundant graphitic laminations and contains discontinuous calcite bands. Sharp upper and lower contacts, fault at the upper contact (moderate intensity).

60.32 62.66 MAFt Undifferentiated mafic volcaniclastic

60.32 - 62.66: Pale green mafic volcaniclastic with a chlorite groundmass. Weakly foliated with concordant calcite bands.

62.66 95.45 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone			92.89	93.90	1.01	B00267816	0.008	-0.3	0.02	-0.01	0.02

62.66 - 95.45: Medium to dark grey laminated mudstone. Calcite alteration throughout most of the interval but absent in high-carbonaceous and silicified sections. Deformation (crenulations and folding) is common in the laminations, calcite bands, and silicified bands. Increase in sulphide abundance (patchy) at 89 m depth.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
		<<Min: 62.66 - 122.53 0.5% Min: Pyrrhotite>> Patches and vein-filling of pyrrhotite and pyrite. Clusters can be up to 3 cm of semi-massive pyrrhotite. Pyrite more common in veins.	93.90	94.65	0.75	B00267817	0.011	-0.3	0.02	-0.01	0.13
		<<Alt: 78.51 - 93.96 Weak-Moderate Silicification>> Sections of silicified mudstone (up to 70 cm in length) accounting for ~5% of the interval. Laminations are folded in silicified sections.	94.65	95.45	0.80	B00267818	-0.005	0.4	0.03	-0.01	0.02
		<<Alt: 93.96 - 266.7 Weak Calcite>> Calcite in bands and groundmass throughout all units. Pervasiveness is variable from trace to weak-moderate throughout the interval and both extremes exist in the mudstone and mafic.									
		<<Struc: 64.04 - 64.57 Trace Fault>> Fault with small fragments and minor gouge.									
		<<Struc: 94 - 94.27 Moderate Fault>> Heavily gouged									
95.45	**100.22**	**MAFt** **Undifferentiated mafic volcaniclastic** 95.45 - 100.22: Pale green mafic volcaniclastic with a chloritic groundmass. Calcite in groundmass varies from none to high abundance (approximately equal to chlorite, 50%). Heavily faulted with intercalated brecciated mudstone in the fault zone.									
		<<Struc: 96.06 - 98.23 Weak-Moderate Fault>> Fault zone, strong intensely gouged from 96.7 to 98 m depth.									
100.22	**100.96**	**MDS** **Undifferentiated carbonaceous mudstone & tuffaceous mudstone** 100.22 - 100.96: Dark grey laminated mudstone with calcite bands. Deformation is present throughout most of the interval.									
100.96	**175.19**	**MAFt** **Undifferentiated mafic volcaniclastic** 100.96 - 175.19: Pale green to medium grey mafic volcaniclastics with intercalated mudstone. The unit varies in textures and mineralogy, but invariably contains chlorite in groundmass and consistently contains calcite and biotite at variable modes. Units include a fine-grained unit (ash?) as well as a fine-grained tuff with large (cm scale) clasts (lapilli?) that are intercalated throughout the interval. Quartz-Calcite-(chlorite/tourmaline/sulphides [po-py-rare sp in calcite band]) veining is abundant in this unit and varies in size from <1 mm to 68 cm; note: from 112.61m to 112.78m, MDS: pale blue, very fine grained banded; biotite-graphite (?)-calcite-chlorite; MAFt: pale green, very fine grained, fine grained and porphyritic biotite; wispy po at contact between mudstone and ash tuff (?), cross-cutting the contact (alteration front?) and marked by po thread.	138.46	139.40	0.94	B00267844	0.007	-0.3	0.01	-0.01	0.23
		<<Min: 122.53 - 154.35 0.1% Min: Pyrrhotite>> Disseminated pyrrhotite in small lenses (< 1 cm) hosted in mudstones and mafic tuffs. Lenses are concordant with foliation & laminations. Pyrite also present but the pyrrhotite is more abundant.	139.40	140.12	0.72	B00267845	-0.005	-0.3	0.02	-0.01	0.02
		<<Min: 139 - 139.1 3% Min: Sphalerite>> In calcite band, associated with py; other calcite band around mineralized has trace po-py-cpy.	142.60	143.21	0.61	B00267819	0.007	-0.3	0.02	-0.01	0.02
		<<Min: 154.35 - 206.63 0.1% Min: Pyrite>> Disseminated pyrite through all lithologies. Typically lenses-shaped (mm scale) concordant to foliation/laminations or in discordant veinlets. In massive veins (Qtz-Ca) can be semi-massive. Disseminated pyrrhotite is also present but is no longer the predominant sulphide.									

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 155.45 - 155.57 Moderate Chlorite>> Chlorite alteration along extremities of a quartz-biotite-chlorite vein containing (globby) massive pyrite and minor chalcopyrite.

<<Vein: 108.04 - 108.72 95% Quartz-Carbonate 60 deg. >>

<<Vein: 142.84 - 142.99 100% Quartz-Chlorite-Sulphide 80 deg. >> Also contains biotite (10%) and carbonate. Pyrite + pyrrhotite present.

<<Vein: 173.99 - 174.29 90% Quartz-Chlorite-Sulphide>> Also contains carbonate, biotite, tourmaline.

<<Struc: 107 - 107 Orientation Lock Angle>> Lock angle between orientation mark at 110 m and 107m.

<<Struc: 115.77 - 115.78 Weak Foliation>>

<<Struc: 124.44 - 124.45 Weak Foliation>>

<<Struc: 131 - 131 Orientation Lock Angle>> Lock angle between orientation mark at 134 m and 131 m.

<<Struc: 133.45 - 133.46 Weak Foliation>>

<<Struc: 145.69 - 145.7 Weak Foliation>>

<<Struc: 169.85 - 169.86 Weak Foliation>>

<<Struc: 174.94 - 175.19 Weak-Moderate Fault>>

175.19 181.89 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

175.19 - 181.89: Black laminated mudstone with abundant calcite banding & Quartz-Calcite veining. Upper contact is a fault (heavily gouged) and lower contact is a gradational deformed zone (historical fault?) with two small (1 cm) gouged surfaces.

181.89 188.00 MAFt **Undifferentiated mafic volcaniclastic**

181.89 - 188: Fine-grained pale green mafic volcaniclastic with a chloritic groundmass. Contains calcite in groundmass and speckled biotite <1 mm that accounts for 1% of the mode. Weakly foliated with concordant calcite bands & quartz-calcite veins.

<<Struc: 184.54 - 185.15 Weak-Moderate Fault>>

188.00 200.88 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

188 - 200.88: Black laminated mudstone with abundant calcite banding and quartz-calcite veining (20% of mode).

<<Vein: 191.29 - 191.57 100% Quarzt-Chlorite-Carbonate>>

<<Struc: 190.96 - 190.97 Moderate Foliation>>

<<Struc: 197 - 197 Orientation Lock Angle>> Lock angle between orientation mark at 197 and 200 m.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 200 - 200 Orientation Lock Angle>> Lock angle between orientation mark at 200 and 203 m.

200.88 205.46 MAFt Undifferentiated mafic volcaniclastic

200.88 - 205.46: Fine-grained pale green mafic volcaniclastic with a chloritic groundmass. Calcite occurs in groundmass, bands, veins (with quartz), and porphyroblastic crystals up to 5 mm and in total calcite accounts for 10% of the mode.

<<Vein: 203.42 - 203.6 85% Quarzt-Chlorite-Carbonate>> Also contains pyrrhotite (2%)

<<Vein: 204.38 - 204.65 100% Quartz-Carbonate-Sulphide>> Predominately quartz (>90%).

<<Struc: 202.65 - 202.66 Weak Foliation>>

205.46 206.16 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

205.46 - 206.16: Dark grey laminated mudstone with abundant discordant quartz-calcite veins (up to 1 cm).

206.16 206.63 MAFt Undifferentiated mafic volcaniclastic

206.16 - 206.63: Fine-grained pale green mafic volcaniclastic. Weakly foliated with concordant quartz-calcite veins (< 5 cm) and discordant pyrite veinlets (1 mm).

206.63 223.61 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

206.63 - 223.61: Black laminated mudstone with abundant calcite alteration in the form of bands and veins (with quartz). Pyrrhotite occurs in elongated patches and strings concordant with the mudstone laminations, and accounts for 3% of the mode.

<<Min: 206.63 - 248.54 2% Min: Pyrrhotite>> Elongated lenses & patches concordant with laminations. 1 mm to 1 cm width.

<<Struc: 211.89 - 211.9 Weak Foliation>>

223.61 225.56 MAFt Undifferentiated mafic volcaniclastic

223.61 - 225.56: Fine-grained pale green mafic volcaniclastic. Interval dominated by massive quartz-calcite veins.

<<Vein: 223.74 - 225.78 90% Quartz-Carbonate>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

225.56 228.60 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

225.56 - 228.6: Black laminated mudstone with calcareous banding (10%).

228.60 230.04 MAFt Undifferentiated mafic volcaniclastic

228.6 - 230.04: Fine-grained pale green mafic volcaniclastic with calcite in groundmass and 1 cm quartz-calcite veins (concordant) throughout the interval.

<<Vein: 228.97 - 229.13 97% Quartz-Carbonate>> 60% Calcite

<<Struc: 230 - 230 Orientation Lock Angle>> Lock angle between orientation mark at 230 and 233 m.

230.04 238.46 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

230.04 - 238.46: Black laminated mudstone with calcite bands and minor Quartz-Calcite veining (generally mm scale with few exceptions).

<<Struc: 232.65 - 232.66 Weak Foliation>>

238.46 239.31 MAFt Undifferentiated mafic volcaniclastic

238.46 - 239.31: Fine-grained pale green mafic volcaniclastic. Sections with biotite porphyroblasts 1-2 mm, 3% of mode.

239.31 239.64 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

239.31 - 239.64: Black laminated mudstone with 1 mm discordant Quartz-Calcite veins.

239.64 239.91 MAFt Undifferentiated mafic volcaniclastic

239.64 - 239.91: Fine-grained pale green mafic volcaniclastic with 3% pyrite in interval.

From (m)	To (m)	Rocktype & Description
239.91	**248.54**	**MDSc** **Carbonaceous dominant mudstone**

239.91 - 248.54: Dark grey to black laminated mudstone. Massive irregular Quartz-Calcite vein (with other minor constituents) from 242 to 243.8 m depth followed by faulting (with veining still present) until 245.8 m depth. Galena in massive vein (243 m depth).

<<Min: 241 - 243 0.1% Min: Galena>> in massive quartz vein

<<Vein: 241.56 - 244.13 90% Quartz-Carbonate-Sulphide>> Sulphides consist of (in order of greatest mode) pyrrhotite, galena, and pyrite for a total of 1%.

<<Struc: 243.63 - 245.75 Weak Fault>> Fault zone with multiple gouged sections generally orientated with the core axis.

<<Struc: 248 - 248 Orientation Lock Angle>> Lock angle between orientation mark at 248 and 251 m.

248.54	**255.47**	**MAFt** **Undifferentiated mafic volcaniclastic**

248.54 - 255.47: Fine-grained pale green mafic volcaniclastic with chlorite & calcite in groundmass and 1 mm speckled biotite (10% of mode) throughout the interval. Sharp upper contact and gradational lower contact. Stockwork pyrite over first 40 cm, Talc and massive Pyrite in vein at 254.3 m depth.

<<Min: 248.54 - 248.9 5% Min: Pyrite>> Stockwork pyrite.

<<Min: 248.9 - 256.56 1% Min: Pyrite>> Disseminated and vein-hosted.

<<Vein: 254.09 - 254.35 10% Carbonate-Sulphide 20 deg. >> Two carbonate-sulphide-talc veins 1 mm and 1 cm respectively. Sulphides are pyrite (massive bleb in vein) and galena.

<<Struc: 249.27 - 249.28 Trace Foliation>>

255.47	**256.20**	**MDS** **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

255.47 - 256.2: Dark grey laminated mudstone with 4% pyrite.

256.20	**256.56**	**MAFt** **Undifferentiated mafic volcaniclastic**

256.2 - 256.56: Fine-grained pale green mafic volcaniclastic with massive quartz vein. Chlorite intensifies proximal to the vein; Calcite in matrix; very fine grained po (trace) disseminated.

256.56 260.39 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

256.56 - 260.39: Dark grey to black laminated mudstone. Calcite banding accounts for 10% of the mode while disseminated/lenses/patches of pyrite and/or pyrrhotite account for 4%. Sharp upper & lower contacts.

<<Min: 256.56 - 300.77 3% Min: Pyrrhotite>> Elongated lenses in calcite bands in MDSc, disseminated blebs (1-2 mm) in MAFt.

<<Min: 256.56 - 338.32 0.1% Min: Pyrite>> and associated with qtz vein

260.39 264.25 MAFt **Undifferentiated mafic volcaniclastic**

260.39 - 264.25: Fine-grained pale-green mafic volcaniclastic, chlorite groundmass dominated with 1 mm calcite and biotite crystals throughout the interval. Quartz-Calcite-(chlorite-sulphides) veins from 1 mm to 20 cm.

<<Vein: 263.99 - 264.25 85% Quarzt-Chlorite-Carbonate>>

<<Struc: 263 - 263 Orientation Lock Angle>>

264.25 266.83 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

264.25 - 266.83: Black laminated mudstone with abundant pyrrhotite.

<<Alt: 266.7 - 300.77 Moderate Calcite>> Lithology controlled

<<Struc: 265.2 - 265.21 Weak Foliation>>

266.83 271.10 MAFt **Undifferentiated mafic volcaniclastic**

266.83 - 271.1: Pale green fine-grained mafic volcaniclastic with a chloritic groundmass. 1 mm Biotite porphyroblasts occur speckled throughout the unit or in 1 cm to 4 cm bands concordant to the foliation that contain high modes (~80%).

<<Struc: 269 - 269 Orientation Lock Angle>> Lock angle between orientation mark at 269 and 272 m.

271.10 285.56 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

271.1 - 285.56: Black laminated mudstone calcite bands and elongated disseminated pyrrhotite at 4%. Deformation occurs throughout the interval as the laminations & calcite bands are commonly folded. Pyrrhotite is most commonly mineralized in the calcite bands but can also be lithology-hosted.

<<Vein: 276.06 - 276.3 70% Quartz-Carbonate-Sulphide 60 deg. >> Calcite-quartz-po semi massive patch/vein

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
		<<Struc: 274 - 274.01 Foliation>>									
		<<Struc: 284 - 284.01 Foliation>>									
285.56	**286.89**	**MAFt** **Undifferentiated mafic volcaniclastic**									
		285.56 - 286.89: Pale green fine-grained mafic volcaniclastic with chloritic groundmass and speckled biotite (1-2 mm). Contains 20 cm gradational margins towards the contacts in which it becomes more calcite-dominated with a medium-grey colour. Both contacts with the mudstone are sharp.									
286.89	**295.09**	**MDS** **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**	293.00	294.09	1.09	B00267823	0.009	0.3	-0.01	-0.01	0.02
		286.89 - 295.09: Black laminated mudstone with calcite bands and elongated disseminated pyrrhotite (3%). Deformation occurs throughout the interval but is more localized than the previous mudstone interval. Section of veining and deformation from 293.44 to 294.00 m depth which contains quartz-calcite veining, folding, and a chlorite-cordierite vein.									
		<<Vein: 293.44 - 293.78 70% Quartz-Carbonate-Sulphide 80 deg. >> Large calcite-minor quartz-po-py-bio patch, possibly cordierite porphyroblasts									
		<<Struc: 289.5 - 289.51 Foliation>>									
295.09	**300.77**	**MAFt** **Undifferentiated mafic volcaniclastic**									
		295.09 - 300.77: Pale green mafic volcaniclastic with a chloritic groundmass and speckled biotite porphyroblasts. Majority (~65%) of the interval is dominated by deformed chlorite/calcite/biotite bands with deformed quartz-calcite veins, which obliterate the original MAFt fabric.									
		<<Vein: 299.8 - 299.82 100% Calcium carbonate/Carbonate 35 deg. >> Calcite veinlet disrupted, cross-cutting foliation, biotite envelope									
300.77	**301.73**	**RHYcf** **Feldspar & quartz phyric rhyolite**									
		300.77 - 301.73: First contact of the KZK formation in K17-448. Volcaniclastic rhyolite with 1 mm to 2 cm quartz/feldspar crystals. Gradational upper & lower contacts in which it transitions from a matrix-dominated (towards the contacts) to a clast-dominated unit.									
		<<Min: 300.77 - 320.9 0.1% Min: Pyrrhotite>>									
		<<Alt: 300.77 - 317.53 Weak-Moderate Calcite>> Replacing lapilli/crystals									

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

301.73 304.00 RHYv Undifferentiated Rhyolite volcaniclastic

301.73 - 304: Medium grey fine-grained volcaniclastic. Contains feldspar/quartz phenocrysts (partially replaced by calcite) akin to the overlying RHYvx unit, however contains a chloritic, groundmass and 1 mm speckled biotite (pepper-texture) that accounts for 10% of the mode. Likely a transition zone from mafic volcaniclastics of the Wind Lake with components (clasts) from the KZK formation. Unit including 5 to 20 cm pelite intercalated.

304.00 308.79 RHYcf Feldspar & quartz phyric rhyolite

304 - 308.79: Start of logging by Jerome de Pasquale; medium grey, fine grained matrix, poorly sorted, medium strained lapilli, subangular crystals (up to 3 cm wide) partially calcite replaced; fine grained biotite-calcite interval from 303.70m to 303.75m; biotite overprint at lower contact/gradational contact with pelite; possible pelitic (biotite bands) at lower contact.

<<Struc: 305 - 305 Orientation Lock Angle>>

<<Struc: 305.5 - 305.51 Foliation>> weak foliation

<<Struc: 308 - 308 Orientation Lock Angle>> Lock angle between orientation mark at 308 and 311 m.

<<Struc: 308.25 - 308.26 dominant foliation>>

308.79 309.55 PEL Equigranular biotite + calcite +/- quartz rock, typically with finely intercalated contacts

308.79 - 309.55: Dark grey to black, weakly foliated, fine grained biotite (70%), calcite blebs (3%), gradational upper contact.

309.55 312.65 RHYcf Feldspar & quartz phyric rhyolite

309.55 - 312.65: Medium grey, medium strained heterogeneous sized, lapilli and probably feldspar phenocrysts, clasts/crystal supported (partially calcite altered), texture showing secondary foliation at upper contact (pseudo granular), locally discontinuous quartz-calcite vein (pods).

312.65 317.53 RHYcf Feldspar & quartz phyric rhyolite

312.65 - 317.53: Medium grey-locally light green (locally chloritic), peppery fine grained biotite (10 to 15%), poorly sorted heterogeneous medium to low strained lapilli and large subangular feldspar phenocrysts (up to 3 cm wide), rare qtz-tourmaline veinlets showing 3 to 5 cm with envelope; possibly pelitic input at lower contact (gradational). Could be part of the unit above showing segregation of the phenocrysts.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

317.53 320.90 MAFta Mafic coarse grained to ash tuff FG

317.53 - 320.9: Grey-green (chlorite), fine grained, peppery biotite (20%) overprint (?), calcareous (15 to 20%), 15 cm calcite-qtz-tourmaline vein-bleaching over 20 cm around, rare calcite discontinuous-deformed veinlets. Possibly part of the Wind Lake Formation.

<<Alt: 317.53 - 320.9 Moderate Calcite>> And banded (veinlets)

<<Vein: 319.5 - 320 5% Calcite 60 deg. >> Carbonate veinlet set ~3/m - beta 160

<<Vein: 320.05 - 320.16 90% Calcium carbonate/Carbonate 50 deg. >> Calcite-quartz-tourmaline vein cross-cutting foliation, minor py

320.90 322.71 RHYcf Feldspar & quartz phyric rhyolite

320.9 - 322.71: Pale green (more intermediate composition), fine grained, rare lapilli (calcite altered) and rare subangular feldspar phenocrysts (matrix supported), chlorite content increases at lower contact, pyrrhotite (2%)-anhedral disseminated PY (2%), qtz-tourmaline veinlets (shallow angle to core axis); bleaching over 5 cm. Possibly part of the Wind Lake Formation.

<<Min: 320.9 - 322.71 2% Min: Pyrrhotite>> rare patches

<<Alt: 320.9 - 332.06 Weak-Moderate Calcite>> Locally patchy and wispy in MDSc

<<Vein: 321.09 - 321.1 100% Quartz 30 deg. >> Quartz vein. Beta 250.

<<Vein: 321.1 - 321.11 100% Tourmaline-Sulphide 30 deg. >> Tourmaline veinlet, minor py, beta 130

322.71 332.06 MDSc Carbonaceous dominant mudstone

322.71 - 332.06: Black-wispy white, fine grained, carbonaceous-calcareous (patchy) pods disseminated and along foliation, gougy-brecciated from 227.74m to 328.75m (30 cm MAFta at lower contact)-euhedral fine grained py.

<<Min: 322.71 - 332.06 0.1% Min: Pyrrhotite>> and associated with qtz vein

<<Struc: 322.71 - 322.71 Contact>> RHYv/MDS

<<Struc: 325.85 - 325.85 dominant foliation>>

<<Struc: 327.74 - 328.75 Strong Fault>> 70% gouge, 30% clasts (up to 2cm, in mudstone and mafic tuff at lower contact-py disseminated and patch (1-2%)

<<Struc: 331.8 - 331.81 dominant foliation>>

332.06 338.32 RHYcf Feldspar & quartz phyric rhyolite

332.06 - 338.32: Light grey-green, peppery biotite (20%), poorly sorted, medium to low strained, coarse lapilli (less probably phenos) in fine grained tuffaceous matrix. Locally pelitic material, fine grain biotite-calcite (from 336.91m to 337.16m and 337.80m to 328.32m).

833.48 835.50 SED **Undifferentiated sedimentary rock**

833.48 - 835.5: Dark green, patchy pinkish (potassic alteration ?), fine to medium grained, mottled; chlorite-calcite-biotite; possibly unconsolidated sediments intruded by hydrothermal alteration fluids (fluidal texture locally); rare biotite at upper contact (833.48 m to 833.80 m), pseudo clastic-siliceous.

<<Alt: 834.2 - 835.4 Moderate-Strong Calcite>>

<<Alt: 835.4 - 838.1 Moderate-Strong Silicification>> including felsic intrusion/dirty quartz vein

<<Alt: 835.4 - 838.1 Weak Calcite>> and veinlets

<<Vein: 835.4 - 836.24 10% Quarzt-Biotite-Sulphides 60 deg. >> Dirty quartz vein of felsic intrusion, biotite patch at contact, peppery biotite-lesser po-py

<<Struc: 835.41 - 835.41 Contact>> contact between altered SED and felsic dike-possibly dirty quartz vein

835.50 836.21 INT **undifferentiated (granitic) intrusive rocks**

835.5 - 836.21: Grey, glassy, massive; peppery biotite-py, quartz tourmaline veinlets undeformed at lower contact; could be dirty quartz vein or felsic intrusion.

836.21 838.10 INT **undifferentiated (granitic) intrusive rocks**

836.21 - 838.1: Green-beige, fine grained matrix, porphyritic (maybe clastic-texture locally obscured), moderately foliated; quartz-chlorite-sericite-biotite porphyroblasts; silicified; contact marked by biotite patches

<<Struc: 837.6 - 837.61 Foliation>> main foliation in possibly porphyritic felsic intrusion (?)

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

838.10 848.62 SED Undifferentiated sedimentary rock

838.1 - 848.62: Grey-green-white (patch-bands-dots); mottled texture, locally clastic; chlorite-calcite-biotite, some dirty carbonaceous interval-light grey-fine grained, possibly preserved original material (?), biotite porphyroblasts (overprint); some green-pearly clasts (?), probably chlorite, possibly fuchsite; two possible intermediate/mafic dykes intercalated (sharp contacts); this units might be an altered mudstone.

<<Alt: 838.1 - 848.61 Moderate-Strong Chlorite>> possibly altered sediments

<<Alt: 838.1 - 848.61 Strong Calcite>>

<<Alt: 848.61 - 861.9 Weak-Moderate Calcite>>

848.62 858.20 MAFw mafic volcanic flows

848.62 - 858.2: Green-black (biotite rich), fine to medium grained, massive; chlorite-quartz-biotite, quartz-calcite veinlets; intermediated composition; fine grained disseminated po (0.5%); possible amygdules; from 854.84 m to 855.86 m, dirty quartz vein or felsic intrusion, glassy, possible feldspar ghosts, sharp contacts showing biotite rich chill margin; biotite rich chill margin at lower contact.

<<Alt: 856.86 - 861.04 Moderate Silicification>> possibly other type of alteration like potassic (hard)

<<Vein: 850.75 - 850.78 90% Quartz-Carbonate 45 deg. >> Quartz-calcite vein showing 2 cm offset (cross-cut by calcite veinlet)

<<Vein: 853.1 - 853.31 80% Quartz-Carbonate 45 deg. >> Quartz-calcite vein containing chlorite-wispy py, po at lower contact

<<Struc: 849.62 - 849.63 Vein>> calcite veinlet set

858.20 858.80 INT undifferentiated (granitic) intrusive rocks

858.2 - 858.8: Light grey-off white, glassy, peppery bi-py-po, quartz-feldspar ghosts (?); contacts marked by fine grained biotite patch (chill margin).

<<Struc: 858.2 - 858.2 Contact>> felsic intrusion, upper contact

858.80 862.27 SED Undifferentiated sedimentary rock

858.8 - 862.27: Black-grey-light green, mottled texture; biotite-chlorite-quartz; blue-grey silica rich mudstone interval from 861.38 m to 861.78 m; from 860.51 m to 860.60 m, glassy dirty quartz vein or felsic intrusion (aplitic dykes?), sharp contacts; this unit could be an altered mudstone showing rare preserved intervals.

<<Alt: 861.9 - 878.34 Moderate-Strong Calcite>>

<<Struc: 858.8 - 858.8 Contact>> felsic intrusion, lower contact

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

862.27 863.12 MAFw mafic volcanic flows

862.27 - 863.12: Grey-green, fine grained, peppery biotite porphyroblasts, massive, calcite veinlets; sericite-chlorite-quartz (siltstone-wacke?).

<<Struc: 862.65 - 862.66 Vein>> calcite veinlet

863.12 870.29 SED Undifferentiated sedimentary rock

863.12 - 870.29: Dark grey-light green, clastic to brecciated texture (mm to 4 cm wide) in fine grained grey matrix dominantly carbonaceous mudstone; biotite-sericite-calcite-brown mica along the foliation-graphite-amphibole; calcite is patchy, wispy and clastic containing elongated-prismatic light green mineral (calcium rich amphibole ?); elongated disseminated po, trace cpy; possible trace fuchsite; unconsolidated sediments hypothesis suggested by preserved texture in some interval, probably disaggregated mudstone.

870.29 870.97 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

870.29 - 870.97: Dark blue, fine grained, weakly foliated to massive; preserved mudstone interval, poorly graphitic-mica-silica

870.97 871.36 WCK Wacke - sandstone with 15-75% clay matrix

870.97 - 871.36: Light green-grey, fine to medium grained, massive, equigranular; chlorite-sericite-biotite; preserved interval within large unconsolidated disturbed sediments (possibly large clasts of permeability/rheology change).

871.36 874.80 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

871.36 - 874.8: Dominantly mudstone and pelite; light blue-grey-light green (altered), fine grained, mottled texture (marked by coarser grain), pelitic interval (fine grained biotite rich from 873.27 m to 873.78 m) thinly foliated; weakly graphitic-calcite in matrix and veinlets (fractures), more chloritic downhole; gradational lower contact.

<<Struc: 872 - 872 Orientation Lock Angle>> Lock angle between orientation mark at 772m and 775.

<<Struc: 873.4 - 873.41 Vein>> average measurement, calcite veinlet set

<<Struc: 873.73 - 873.74 Foliation>> main foliation, well marked in biotite rich interval (pelite ?)

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
874.80	**878.34**	**SED** **Undifferentiated sedimentary rock** 874.8 - 878.34: Light green-beige-grey, locally spotty texture (amygdule [calcite] ?) in different intervals; mottled texture; chlorite-biotite-calcite-sericite; possibly hydrothermally altered calcareous mudstone (fluid circulation); sharp lower contact. <<Alt: 874.9 - 879 Weak-Moderate Albite>> possibly potassic alteration <<Alt: 875 - 878.34 Weak Chlorite>> seems strongly hydrothermally altered, possibly chlorite and/or green mica/sericite ?									
878.34	**885.70**	**MAFw** **mafic volcanic flows** 878.34 - 885.7: Green-spotty brown mice (porphyroblasts?); fine to medium grained matrix, massive, homogeneous-equigranular; chlorite-sericite-quartz-fine grained biotite-brown mica-calcite trace; py in thin fractures; intermediated composition (?); dirty quartz vein at lower contact, biotite fading out at contacts (sharp); <<Alt: 878.34 - 887 Weak-Moderate Calcite>> <<Vein: 880 - 885.7 2% Calcite 60 deg. >> Calcite veinlets set and quartz-calcite veins averaging 8/m <<Struc: 879.9 - 879.91 Vein>> calcite veinlet set <<Struc: 884 - 884 Orientation Lock Angle>> Lock angle between orientation mark at 884 m and 887 m. <<Struc: 885.25 - 885.26 Vein>> quartz-calcite veinlet									
885.70	**887.00**	**SED** **Undifferentiated sedimentary rock** 885.7 - 887: Grey-dark green, dominantly fine grained, chlorite-sericite-biotite banded; wispy aggregated py-po; volcaniclastic-clastic interval from 885.70 m to 886.07 m with upper contact (medium strained lapilli-partially calcite altered), quartz-sericite; sharp lower contact, light shearing and sericite alteration. <<Min: 886.03 - 886.85 3% Min: Pyrrhotite>> in the foliation <<Min: 886.03 - 897.02 0.5% Min: Pyrite>> as clasts at upper and lower contact of the volcaniclastic unit <<Min: 886.85 - 897.02 0.5% Min: Pyrrhotite>> <<Alt: 885.7 - 887 Weak-Moderate Chlorite>> <<Alt: 885.7 - 888 Weak-Moderate Muscovite>> associated with volcaniclastic interval and light shearing	886.07	887.00	0.93	B00267801	0.007	-0.3	0.02	-0.01	0.02
887.00	**894.04**	**RHYcf** **Feldspar & quartz phyric rhyolite** 887 - 894.04: Light grey, porphyritic (1 to 3 cm feldspar phenocrysts-some randomly oriented/rotated (?)), well foliated, silicified, augen texture; quartz-sericite-biotite porphyroblasts; disseminated and aggregated py (1-2%), py clasts at upper and lower contact, light shearing and yellow-greenish alteration obscuring texture (sericite/epidote at lower contact ?); could be volcaniclastic (RHYvl, large clasts or porphyroblastic-RHYvx)). <<Alt: 887 - 894.22 Trace Calcite>> in rare fracture	887.00	888.00	1.00	B00267802	0.005	-0.3	0.02	-0.01	0.16

957.61 964.51 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

957.61 - 964.51: Black-dark blue, fine to very fine grained, moderately foliated; wispy calcite and calcite-quartz deformed veinlets, spider web texture, locally lithic fragments; dominantly strongly graphitic and siliceous, some calcite rich (limestone bands); graphite-quartz-biotite-calcite; wispy and fracture infilled py (3-5%) and lesser po; sawtooth upper contact, sheared lower contact, gougy (30% clay).

<<Min: 957.61 - 964.51 4% Min: Pyrite>>

<<Min: 957.61 - 964.51 0.1% Min: Pyrrhotite>>

<<Struc: 964 - 964.01 dominant foliation>> thin foliation in graphitic mudstone

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

964.51 966.12 MAFw mafic volcanic flows

964.51 - 966.12: Intermediate composition; dark green-beige-spotty black (biotite porphyroblasts); medium grained in the central part, finer grained at contact, bleached texture (biotite ghosts), biotite-sericite-chlorite-calcite (matrix and veinlets)-quartz; possibly amygdules at upper contact (suggesting extrusive origin); light shearing-faulting at upper and lower contact.

<<Min: 964.51 - 966.12 0.1% Min: Pyrite>> associated with quartz veinlet

966.12 972.75 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

966.12 - 972.75: Dark blue to gray (non carbonaceous), fine grained, moderately foliated, siliceous; faulted from 966.70 m to 967.30 m, non carbonaceous from 269.60 m to 971.75 m; quartz-biotite-sericite-lesser graphite and calcite in fault zone; from 971.75 m to 972.75 m, mottled texture (mesothermal fluids, possibly alteration front), original texture obscured by possibly potassic alteration and chlorite enrichment, dark brown mica porphyroblasts, calcite trace, silica flooded (hard); interpreted at mafic in unconsolidated sediments (?); sharp lower contact.

<<Min: 966.12 - 985 0.5% Min: Pyrrhotite>>

<<Min: 966.12 - 999.37 0.1% Min: Pyrite>> rare veinlets

<<Alt: 968 - 972.75 Moderate-Strong Silicification>> possibly potassic alteration

<<Alt: 968 - 976.9 Weak Calcite>> and blebs

<<Struc: 966.12 - 966.13 Weak-Moderate Shear>> at contact between possibly mafic dyke and mudstone (5% gouge)

<<Struc: 966.8 - 967.4 Moderate Fault>> possibly strong, clay gouge washed during drilling, weakly brecciated/sheared at lower contact

<<Struc: 968.7 - 968.71 dominant foliation>> wavy foliation, secondary foliation weakly developed

<<Struc: 971 - 971 Orientation Lock Angle>> Lock angle between orientation mark at 971 m and 874 m

972.75 975.07 MAFw mafic volcanic flows

972.75 - 975.07: Green-peppery black (biotite), fine grained matrix, massive, equigranular, chlorite-sericite-quartz, calcite in thin veinlets and calcite trace in matrix; interpreted as mafic flow with regards to texture and alteration above.

<<Struc: 972.75 - 972.75 Contact>> should be the contact, not 100% sure

975.07 976.56 SED Undifferentiated sedimentary rock

975.07 - 976.56: Grey-green-beige mottled texture, biotite (black mice) porphyroblasts, and fine grained biotite in matrix; sericite-quartz-biotite-chlorite (patchy)-calcite trace; calcite bands and fine grained mica patches at upper contact (margin), sharp lower contact.

<<Alt: 975.07 - 978.56 Moderate Silicification>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

976.56 977.83 MAFw mafic volcanic flows

976.56 - 977.83: Dark grey-black, fine to medium grained, equigranular-homogeneous, very weakly foliated; biotite-calcite-sericite; possibly amygdule and composition suggesting extrusive origin, could be sedimentary.

<<Alt: 976.9 - 977.85 Strong Calcite>>

977.83 978.86 SED Undifferentiated sedimentary rock

977.83 - 978.86: Dark green-grey-brown mottled texture, biotite porphyroblasts; silicified (?); quartz-sericite-biotite-lesser calcite-possibly kspar and brown mica; sharp contacts.

<<Alt: 977.85 - 991.4 Weak Calcite>>

978.86 981.44 MAFw mafic volcanic flows

978.86 - 981.44: Dark green, fine grained, very weakly foliated to massive, homogeneous, rare biotite porphyroblasts, calcite veinlets sets; chlorite-sericite-calcite-biotite-epidote(?: light green mineral in calcite patch); composition contrasting with silicified units above and underneath as well as lack of significant metasomatic alteration; sharp upper and lower contact.

<<Struc: 980 - 981 Vein>> calcite veinlet set, 6/m

981.44 989.60 SED Undifferentiated sedimentary rock

981.44 - 989.6: Light grey-blue-beige-dark green mottled texture, fine grained, weakly foliated; heterogeneous units possibly altered and silicified dominantly mudstone and siltstone (light grey); sericite-quartz-biotite; at 986.46 m, possibly preserved primary bedding; sharp contacts.

<<Min: 985 - 992 2% Min: Pyrrhotite>>

<<Alt: 981.44 - 989.61 Weak Chlorite>>

<<Alt: 981.44 - 999.37 Moderate-Strong Silicification>> possibly part of lithology, silica rich mudstone.

<<Struc: 984.25 - 984.26 Foliation>> possibly dominant foliation, obscured by drill grinding

<<Struc: 986 - 986 Orientation Lock Angle>> Lock angle between orientation mark at 983 m and 986 m

<<Struc: 986.35 - 986.36 Foliation>> looks like primary bedding (?)

<<Struc: 988 - 988.01 Foliation>> possibly dominant foliation

<<Struc: 988.44 - 988.44 Contact>> contact or dominant foliation

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K17-449

Prospect:	ABM	Hole Type:	DD	Survey Type:	GPS	Logged By:	Jerome de Pasquale
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Trent Newkirk	Date Logging Start:	9/19/2017
UTM Easting	414691	Core Size:	HQ3	Azimuth:	177.14	Date Logging Complete:	10/17/2017
UTM Northing:	6817002	Casing Pulled?:	No	Dip:	-83.34	Drill Company:	New Age
UTM Elev. (m):	1420	Casing Depth (m):	9	Length (m):	800	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	9/17/2017
Local Northing:		Cemented?:	No	Core Storage Loc.:	KZK Camp	Drill Completed:	9/30/2017
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Exploration
Comments:						Parent Hole:	

Purpose: Collared for exploration and downhole seismic testing. Acoustic Impedance as well as Specific Gravity measurements were recorded every metre. Non-cemented at date and casing preserved for geophysics survey.
From top to 364.27 m, K17-449 consists dominantly in mudstone (MDS) and mafic volcanic sediments intercalated (MAFt/SLT/WCK/SED).
Porphyritic units (RHYcf) are intercepted intermittently from 364.27 m to 414.37 m.
Mafic and sedimentary sequences are observed from 414.37 m to 514.53 m.
From 514.5m to 800.00 m, K17-449 shows more intermediate volcaniclastic and felsic (silicified) units. Mudstone and mafic rocks are still present.
Alteration consists in calcite and biotite all along the hole, and sparse silicification. A possible tourmaline altered zone is encountered from 242.31 m to 296.00 m.
Pyrite and pyrrhotite-locally associated with trace chalcopyrite-are commonly seen from top to bottom. Also, pyrite veinlets crosscutting the foliation are frequently observed.
A poorly developed stringer zone mineralized sphalerite-galena-chalcopyrite-pyrite from 374.00 m to 375.55 m constitutes the most significant VMS signature interval recognized in K17-449. It occurs within felsic porphyritic unit (RHYcf).
K17-449 was completed and shut down at 800.00 m.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 7.90 OVBN Overburden

0 - 7.9: Mafic tuff and carbonaceous mudstone rubbles; 9 m of casing.

7.90 18.02 MAFta Mafic coarse grained to ash tuff

7.9 - 18.02: Wacke; light green-beige, fine grained, weakly foliated; rare more carbonaceous interval showing lithic fragments (at 8.50m); chlorite-sericite-calcite; rare py in veinlets; abundant calcite/calcite quartz veinlets and patches; from 16.00m to 18.02m, bleaching proximal to massive quartz-calcite veins, quartz-calcite vein (10cm) at lower contact.

<<Min: 7.9 - 22.5 0.1% Min: Pyrite>> Dominantly associated with quartz-calcite veins

<<Min: 7.9 - 33.1 0.1% Min: Pyrrhotite>>

<<Alt: 7.9 - 18.02 Strong Calcite>>

<<Vein: 14.5 - 17 25% Quartz-Carbonate>> Quartz-calcite veins/pods averaging 10 cm and representing 25% of the interval; bleached mafic tuff, poorly calcareous

18.02 22.50 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

18.02 - 22.5: Black-dark blue, fine to very fine grained, foliated, white irregular veinlets; graphite-quartz-calcite-biotite; faulted and weakly brecciated at upper contact, sharp lower contact;

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 18.02 - 22.5 Weak Calcite>> Calcite veining

<<Struc: 18.12 - 18.4 Weak Fault>> Quartz vein at upper contact, weakly brecciated at lower contact; 20% clay gouge

22.50 26.45 MAFta Mafic coarse grained to ash tuff

22.5 - 26.45: Green, fine to medium grained, possibly lapilli calcite replaced ; poorly foliated; chlorite-calcite-sericite-quartz;-biotite (trace); py disseminated trace; quartz-calcite veins (5%); sharp contacts.

<<Min: 22.5 - 33.1 0.5% Min: Pyrite>> Few py trains and few trace in bull quartz vein

<<Alt: 22.5 - 26.45 Weak-Moderate Calcite>> And veinlets

26.45 28.00 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

26.45 - 28: Black-dark blue, very fine grained, foliated (15cm gouge), weakly faulted; graphite-quartz-quartz-calcite thin bands weakly deformed; sharp contacts.

<<Alt: 26.45 - 68 Weak-Moderate Calcite>> Calcite band, locally strong, dominantly weak to moderate

28.00 33.10 MAFta Mafic coarse grained to ash tuff

28 - 33.1: Light green-beige (bleached), fine grained, poorly foliated; chlorite-sericite-calcite; py disseminated trace to 0.5%; possibly lapilli calcite replaced; interval marked by moderate faulting and large bull quartz veins (60% of the interval), mudstone intercalated-deformed-weakly sheared; sharp contacts.

<<Min: 31.2 - 33.1 0.1% Min: Galena>> In bull quartz vein, upper part of the unit

<<Vein: 31.2 - 33.1 90% Quartz-Carbonate-Sulphide>> Two bull quartz veins and 50 cm mudstone interval intercalated; white, calcite in fracture, py-gl (trace) at upper contact

<<Struc: 32 - 32.3 Weak-Moderate Fault>> Intensity could be over estimated, poor recovery and possibly gouge washed during drilling; 30% clay gouge in mudstone interval in between large bull quartz veins

33.10 80.90 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

67.76	68.96	1.20

33.1 - 80.9: Black-dark blue, fine to very grained, foliated, calcite bands and patches, thinly foliated; graphite (strong conductivity)-calcite-biotite-lesser quartz; locally deformed, crenulation cleavage and preserved lithic fragments; some large calcite patches (over 20cm), abundant calcite from 68.00 m to 81.07 m; light blue, strongly calcareous bands (limestone trend?); biotite associated with calcite patch and wispy po (5%)-wispy py ((2-3%)-cpy trace; some light green, fine grain, poorly foliated intervals (MAFt)-chlorite-sericite-calcite; sharp contacts; upper contact marked by massive quartz vein, py veins, py in quartz and brown mineral calcite-possibly tourmaline.

625.02 - 626.1: Green, large biotite phenocrysts.											
626.10	**627.34**	**RHYcw Curdy textured-flow banded coherent rhyolite (flows, subvolcanics) grey-brown FMG**									
626.1 - 627.34: Siliceous flow banded rhyolite. Abundant py throughout											

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
			633.14	634.20	1.06						

627.34 636.63 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green FCG

627.34 - 636.63: Pistachio green, heavily fractured. Abundant bt porphyroblasts, as well as relict k-spar porphyroblasts altered to sericite.

<<Min: 634.22 - 650.36 0.5% Min: Pyrrhotite>> Very sparse, but found throughout section

<<Min: 634.22 - 650.36 0.1% Min: Chalcopyrite>> Very sparse, associated with po mineralization

<<Alt: 629.47 - 634.32 Moderate Calcite>> Replacing clasts, and in abundant veinlets

<<Alt: 634.32 - 645.11 Moderate Calcite>> Mostly in veins, occasionally replacing clasts

<<Vein: 631.85 - 641.25 10% Quartz>> Patchy, massive quartz + calcite veining

636.63 638.72 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone green-brown FMG

636.63 - 638.72: Finely bedded heterogeneous carbonaceous mudstone, with siliceous bands.

638.72 643.30 MAFt Undifferentiated mafic volcaniclastic green FMG

638.72 - 643.3: Some spots very bt rich. Calcite porphyroblasts replacing feldspars. Generally massive with some banding.

<<Struc: 640.5 - 640.55 Moderate Foliation>>

<<Struc: 643.25 - 643.3 Moderate Foliation>> Calcite band

643.30 647.40 RHYi Aphanitic Rhyolite (intrusion) grey-green FG

643.3 - 647.4: Green-grey fine grained, intrusive rhyolite. Some bt porphyroblasts. Speckled with vfg pyrite throughout. Carbonaceous bands.

<<Alt: 645.11 - 645.9 Weak-Moderate Silicification>>

<<Alt: 645.9 - 663.27 Moderate Calcite>> Mostly banded, but also in veins, and as replacement clasts

647.40 650.31 MAFt Undifferentiated mafic volcaniclastic green-brown FMG

647.4 - 650.31: Occasional calcite bands, massive, unfractured. Calcite porphyroblasts replacing feldspars.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

650.31 652.63 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone green-brown FG

650.31 - 652.63: Chaotic siliceous bands. Pyrite speckled throughout the segment.

<<Min: 650.36 - 653.47 2% Min: Pyrrhotite>> Disseminated and patchy, often occurring along foliation. Also occasional py intermixed with po

652.63 655.81 RHYi Aphanitic Rhyolite (intrusion) grey-green VFG

652.63 - 655.81: Intrusive rhyolite, semi-massive. Abundant qtz veining throughout. Siliceous.

<<Struc: 652.65 - 652.7 Moderate-Strong Bedding>>

655.81 661.72 FLZ Fault Zone green FCG

655.81 - 661.72: Gougy fault zone, with large qtz veins, probably due to fluid flow in fault. Poorly sorted, clast bearing, crumbly.

<<Vein: 657 - 675 35% Quartz>> Abundant patchy and massive qtz + calcite veins found throughout this section. Commonly have trace amounts of patchy po and py found in fractures.

661.72 664.07 RHYv Undifferentiated Rhyolite volcaniclastic green FMG

From (m)	To (m)	Width
662.48	663.37	0.89

661.72 - 664.07: Siliceous, banded volcaniclastic rock. Abundant large qtz veins throughout. Several carbonaceous domains.

<<Min: 662.8 - 663.96 1% Min: Pyrrhotite>> Often patchy, occurring along fractures in massive qtz veins.

664.07 666.97 RHYi Aphanitic Rhyolite (intrusion) grey-green FG

664.07 - 666.97: Massive to very weakly foliated, light grey-green felsic intrusive rock. Sparse biotite porphyroblasts, increasing close to contacts.

<<Alt: 665.11 - 667.81 Weak Calcite>>

666.97 670.90 MDSt Rhyolite tuff dominant mudstone grey-green FMG

From (m)	To (m)	Width
669.90	670.90	1.00

666.97 - 670.9: Bt porphyroblasts throughout, chaotic calcareous mudstone bands, otherwise quite siliceous.

<<Min: 669.8 - 670.7 1% Min: Chalcopyrite>> Occurs as mm size blebs, along foliations and flow bands. Po commonly occurs with CP

<<Alt: 667.81 - 677.3 Weak Calcite>> Occurs primarily as replacing relict clasts. Occasionally banded, or found in veins

<<Vein: 670.61 - 670.71 15% Quartz>> 1 cm thick cross cutting qtz veinlets

<<Struc: 670.75 - 670.8 Strong dominant foliation>>

From (m)	To (m)	Rocktype & Description			From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
670.90	**678.50**	**RHYi**	**Aphanitic Rhyolite (intrusion)**	**grey-green** **FG**	673.07	674.00	0.93						

670.9 - 678.5: Aphanitic rhyolite, with some sections having bt-rich domains. Calcite clasts replacing feldspar found throughout. Slightly porphyritic qtz textures can be observed. Vfg pyrite found throughout.

<<Min: 673.22 - 675.15 4% Min: Pyrrhotite>> Occurs as large, patchy blebs in large, massive qtz veins | 674.00 | 675.00 | 1.00 |

<<Alt: 677.3 - 679.4 Moderate-Strong Calcite>> In a fault zone, heavily altered.

<<Vein: 676.8 - 677 5% Tourmaline>> 0.5 cm thick, black tourmaline veinlets

678.50	**679.41**	**FLZ**	**Fault Zone**	**grey-green** **FCG**

678.5 - 679.41: Gougy fault zone. Crumbly.

<<Alt: 679.4 - 686.21 Weak-Moderate Calcite>> Occurs primarily in bands, and often replacing clasts

679.41	**684.11**	**RHYvl**	**Lapilli tuff**	**grey** **FMG**

679.41 - 684.11: Light grey, "curdy" siliceous volcaniclastic. Bt content ranges from sparse to abundant.

<<Min: 681.4 - 684.22 0.5% Min: Pyrrhotite>> Occasional patchy, 1-3mm size Po and occasionally py mineralization

684.11	**685.43**	**RHYcw**	**Curdy textured-flow banded coherent rhyolite (flows, subvolcanics)**	**grey-green** **FMG**

684.11 - 685.43: Rhyolitic flow. Moderately fractured. Abundant bt porphyroblasts. Siliceous.

685.43	**690.25**	**RHYvl**	**Lapilli tuff**	**grey-green** **FMG**

685.43 - 690.25: Gougy, several small faults running through zone. Heavily fractured rock. Light grey, curdy siliceous volcanoclastic rock.

<<Alt: 686.21 - 689.28 Moderate Calcite>>

<<Alt: 689.28 - 692.22 Weak-Moderate Calcite>>

<<Vein: 688.01 - 689.28 20% Quartz>> Massive bull qtz + calcite veins

690.25	**696.86**	**MAFt**	**Undifferentiated mafic volcaniclastic**	**green** **FMG**

690.25 - 696.86: Dark green mafic tuft, with varying degrees of porphyritic biotite. Cross cut by massive qtz veins, and smaller calcite veins.

<<Alt: 692.22 - 693.25 Moderate Calcite>>

<<Alt: 693.25 - 696.8 Weak Calcite>>

<<Alt: 696.8 - 705.47 Moderate Calcite>> Occurring as calcite replacement, in bands and veins

<<Vein: 695.8 - 698.2 8% Quartz>> Massive Bull qtz + calcite veins

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 694.3 - 694.35 Moderate-Strong Foliation>> Biotite layer

696.86 705.48 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone green-brown FG

696.86 - 705.48: Brownish-green, heterolithic mudstone. Abundant carbonaceous bands. Quite silicified, with cherty beds.

<<Min: 702.47 - 708.51 4% Min: Pyrrhotite>> Wispy and patchy po, and occasion py found throughout

<<Alt: 705.47 - 729.44 Moderate-Strong Silicification>>

705.48 709.88 RHYcw Curdy textured-flow banded coherent rhyolite (flows, subvolcanics) grey-green FG

705.48 - 709.88: Chaotic flow bands, and lapilli tuffs. Cross-cut by several 20-30cm massive qtz veins. Moderate amount of bt found throughout. Poorly foliated.

<<Vein: 706.7 - 708.49 50% Quartz>> Massive bull qtz vein

709.88 724.45 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey FMG

709.88 - 724.45: Large mafic intrusion. Extremely bt-rich in some places. Quite siliceous, with occasional calcite bands. Possible tourmaline in matrix. Abundance of qtz veins support that this is a large mafic dyke.

<<Min: 712.1 - 716 3% Min: Pyrrhotite>> Wispy po, and rarer py along foliation, often replacing biotite.

<<Min: 717.86 - 724.11 2% Min: Pyrite>> Usually occurs with po

<<Min: 717.86 - 724.11 7% Min: Pyrrhotite>> Occurs along foliation

<<Vein: 712.8 - 718.7 20% Quartz>> Massive, patchy qtz veins, often have tourmaline along grain boundary. Po, Chl, and bt infill spaces where there are no qtz

<<Vein: 721.25 - 721.3 15% Tourmaline 65 deg. >> Hairline tourmaline vein

<<Vein: 721.3 - 737.66 85% Quartz>> Massive bull qtz veins and intrusive rhyolite veins. Often with tourmaline along grain boundaries. Sometimes veins develop a dendritic texture (at 730.25m, for example). Py and po also occurring in close proximity to veins

724.45 727.16 RHYi Aphanitic Rhyolite (intrusion) grey VFG

724.45 - 727.16: Igneous intrusive. Trace bt-porphyroblasts, trace py, po.

727.16 729.06 MAFi Mafic Intrusions (primarily footwall mafic intrusion) brown FG

727.16 - 729.06: Mafic intrusive. Very dark and fine grained. Very siliceous. Abundant cross-cutting massive qtz veins

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

729.06 730.38 RHYi Aphanitic Rhyolite (intrusion) grey-brown FG

729.20	730.05	0.85

729.06 - 730.38: Igneous intrusive. Possible dyke swarm, with both a felsic and a mafic source. Trace bt. Bottom contact has abundant bladed tourmaline.

<<Min: 730.25 - 731 0.5% Min: Chalcopyrite>> Small cp crystals speckled throughout

730.38 734.72 RHYv Undifferentiated Rhyolite volcaniclastic grey-green FMG

730.38 - 734.72: Very dark for a rhyolite. Heavily silicified. Secondary sericite + bt. Foliations are formed along bt-rich layers.

<<Min: 731 - 739.04 1% Min: Pyrite>> Occurs with po

<<Min: 731 - 739.04 2% Min: Pyrrhotite>>

734.72 737.76 MAFt Undifferentiated mafic volcaniclastic grey-green FMG

734.72 - 737.76: Dark green, banded. Porphyritic biotite secondary, as well as primary biotite.

<<Alt: 734.72 - 750.74 Moderate-Strong Silicification>>

<<Alt: 734.72 - 750.74 Moderate-Strong Biotite>> Abundant porphyritic biotite, as well with sericite, forming banded foliation

737.76 755.64 RHYv Undifferentiated Rhyolite volcaniclastic grey-green FMG

751.25	752.12	0.87

737.76 - 755.64: Dark, heavily silicified rhyolite. Secondary sericite + bt. Common po. Several 20-60 cm rhyolitic dikes intrude through this section. There is also a heavily altered mafic dyke from 749.04-750.24, with gritty patches of silicified talc.

<<Min: 752.22 - 755.6 2% Min: Pyrite>> Occurs with po

753.50	754.50	1.00

<<Min: 752.22 - 755.6 4% Min: Pyrrhotite>> Occurs along foliation, also in veins and as bt replacement.

<<Min: 752.22 - 755.6 0.25% Min: Chalcopyrite>>

<<Alt: 750.74 - 762.85 Moderate Calcite>>

<<Alt: 750.74 - 800 Moderate Silicification>> Entire run of core has been heavily silicified.

<<Vein: 747.4 - 747.5 50% Tourmaline>> Tourmaline + Bt veinlet set

<<Vein: 749.8 - 749.82 100% Tourmaline>> Tourmaline veinlet crosscutting rhyolitic dyke

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

755.64 762.90 SED Undifferentiated sedimentary rock green-brown FG

755.64 - 762.9: Green-pink-brown carbonaceous sedimentary rock. Green-white-pink banding. Relict beds preserved in some places. Porphyritic secondary bt is present throughout, although it appears to be bleached from about 759.7 to 760.4. Heavily chlorite altered.

<<Vein: 756.5 - 800 15% Quartz>> Massive qtz + calcite veins, varying in thickness from several cm to 30 cm

<<Struc: 759.65 - 759.7 Strong Shear>>

762.90 767.30 SED Undifferentiated sedimentary rock green FG

762.9 - 767.3: Greenish-brown sedimentary rock. Similar to lithology described above, but more siliceous, and with thicker bands. Secondary bt various from about 5%-50%.

<<Alt: 764 - 767.77 Weak-Moderate Calcite>>

767.30 770.05 RHYva Coarse grained to ash tuff grey MCG

767.70	768.69	0.99

767.3 - 770.05: Creamy white/pistachio green rhyolitic unit. Siliceous, mottled texture.

<<Vein: 768.48 - 768.49 100% Tourmaline>> Tourmaline veinlet

768.69	769.68	0.99

770.05 773.48 SED Undifferentiated sedimentary rock green FCG

770.05 - 773.48: Green massive sedimentary rock. Abundant calcite bands, large (up to 1 cm) bt porphyroblasts found throughout.

<<Alt: 770.1 - 800 Moderate Calcite>> Occurring in bands, or veins. Occasionally as replacement clasts. 800 m E.O.H.

773.48 796.84 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone dark grey FG

783.80	784.70	0.90

773.48 - 796.84: Large unit of dominantly dark blueish-grey silicified mudstone. Can also be olive green in some area, likely due to hydrothermal fluid interaction, or slight compositional differences. V. fine grained siltstone from about 786-793, after this coarser grained mudstone. Abundant qtz/calcite veins throughout this section suggest heavy hydrothermal fluid interaction.

<<Min: 776.15 - 783.2 3% Min: Pyrite>> Large py patches occurring in veins, and some in foliation

784.70	785.73	1.03

<<Min: 776.15 - 783.2 2% Min: Pyrrhotite>>

785.73	786.47	0.74

<<Min: 776.15 - 783.2 1% Min: Chalcopyrite>>

<<Min: 783.2 - 787.97 8% Min: Pyrite>> Abundant pyrite forming primarily in veins, but also along foliation planes

<<Min: 792.4 - 796.4 2% Min: Pyrite>> Occurs with po

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
<<Min: 792.4 - 796.9 6% Min: Pyrrhotite>>											
<<Vein: 783.6 - 784.8 5% Pyrite>>		Abundant pyrite veinlets									
<<Vein: 786.7 - 789.8 5% Quartz>>		Hairline qtz veins.									
796.84	**800.00**	**SED Undifferentiated sedimentary rock green FG**									
796.84 - 800: Dark green, banded. Porphyritic biotite secondary, as well as primary biotite. 1-3 cm thick calcite bands. 800 m E.O.H.

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	9/30/2017
Local Northing:		Cemented?:	No	Core Storage Loc.:	KZK Camp	Drill Completed:	10/3/2017
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Exploration
Comments:						Parent Hole:	

Purpose: Collared for downhole seismic testing and resource calculation. Acoustic Impedance measurement and Specific Gravity proceeded every metre. Also named hole P17-006.
K17-450 hanging wall shows of volcaniclastic (RHYv) and coherent rhyolite (RHYc) with pelite (PEL) units and mafic dykes (MAFi) intercalated.
Mineralization zone is intercepted from 144.60 m to 171.14 m and consists dominantly in OB and OA domains. Chalcopyrite (associated with pyrrhotite-OC/OG domains) is locally abundant; pyrite-sphalerite-galena+/-magnetite constitutes the main mineral assemblage.
The mafic footwall (MAFi) is observed at 171.14 m and seems talc altered.
Muscovite alteration increases from 124.16 m to 144.60 m. Strong proximal chlorite-cordierite alteration is seen from 145.66 m to 147.17 m.
K17-450 is also marked by dolomitization from 17.63 m to 30.00 m and silicification associated with muscovite alteration from 173.71 m to 175.72 m. The latter suggests RHYi (aphanitic rhyolite) proximity.
K17-450 was successfully completed. Seismic test is planed end of October.
K17-450 was shut down at 182.00 m.

<<Alt: 5 - 10.72 Weak-Moderate Dolomite>>

10.32 17.63 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

10.32 - 17.63: Brown-beige, fine grained, poorly foliated, quartz veined; calcite-biotite-quartz-rare chlorite; possibly abundant amygdules suggesting volcanic intrusive origin-intermediate composition; (?) patchy py-po; gradational (chill margin?) contacts.

<<Min: 10.72 - 45 2% Min: Pyrrhotite>>

<<Alt: 10.72 - 17.63 Strong Calcite>>

<<Vein: 11.5 - 15 10% Quartz-Carbonate 45 deg. >> Quartz-calcite wavy veinlet sets

<<Struc: 10.7 - 10.71 dominant foliation>> Foliation weakly marked

<<Struc: 12.8 - 12.81 Vein>> Calcite-quartz veinlet set, possibly foliaform

17.63 24.89 RHYv Undifferentiated Rhyolite volcaniclastic

17.63 - 24.89: Beige-pale yellow-grey, fine grained, silica banded to foliated; quartz-sericite-dolomite-lesser calcite-biotite; fine grained calcite-biotite narrow interval from 20.24m to 21.14m, mafic-to intermediated dyke or polite (?); tourmaline veinlet along the core axis (envelope penetrating foliation); heterogeneous interval showing locally bleaching, quartz-dolomite bands; weakly to moderately faulted; contact obscured by alteration.

<<Alt: 17.63 - 24.89 Weak-Moderate Calcite>>

<<Alt: 17.63 - 30 Moderate-Strong Dolomite>> Associated with quartz bands

<<Vein: 22 - 23 5% Tourmaline 5 deg. >> Tourmaline veinlet along the core axis, associated with quartz, fault gouge and dolomite alteration

<<Struc: 22 - 24.3 Moderate Fault>> Associated with dolomite alteration and tourmaline veinlet along the core axis

24.89 27.09 PEL Equigranular biotite + calcite +/- quartz rock, typically with finely intercalated contacts

24.89 - 27.09: Brown-beige, very fine grained, poorly foliated; biotite-calcite-quartz, possibly intermediate composition dyke; locally bleached-beige and silty texture; patchy py-po.

<<Alt: 24.89 - 27.09 Strong Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

27.09 46.55 RHYv Undifferentiated Rhyolite volcaniclastic

27.09 - 46.55: medium grey, fine to medium grained, foliated; poorly sorted, some medium strained lapillis; quartz-sericite-muscovite; patchy pyrite associated with glassy grey quartz bands, quartz-dolomite (possibly ankerite)-calcite bands at upper contact (hydrothermal alteration); chlorite or green mica blebs; gradational contacts.

<<Min: 27.09 - 45 2% Min: Pyrite>> And patchy

<<Min: 45 - 112 5% Min: Pyrite>> And disseminated

<<Min: 45 - 112 3% Min: Pyrrhotite>> And disseminated

<<Alt: 27.09 - 171.14 Trace Calcite>>

<<Struc: 28.9 - 28.91 dominant foliation>>

<<Struc: 31.4 - 31.41 dominant foliation>> Foliation weakly marked

<<Struc: 33.2 - 37.21 dominant foliation>>

<<Struc: 36.1 - 36.11 dominant foliation>>

<<Struc: 39.3 - 39.31 Foliation>> Secondary foliation

<<Struc: 43.9 - 43.91 dominant foliation>>

<<Struc: 45.9 - 45.91 dominant foliation>>

46.55 50.30 RHYva Coarse grained to ash tuff

46.55 - 50.3: Light grey, fine to medium grained, well sorted, foliated; sericite-quartz-locally fine grained biotite; interval showing possible repeating sedimentary sequences (graded bedding?); gradational contacts.

<<Struc: 49.95 - 49.96 dominant foliation>>

50.30 54.40 RHYv Undifferentiated Rhyolite volcaniclastic

50.3 - 54.4: Medium grey, fine grained matrix, crystal fragments or clast-medium strained, poorly sorted, foliated; locally silicic wavy bands; sericite-quartz-ankerite replacing clasts; pyrite stringers associated with grey glassy quartz bands, patchy po; probably reworked volcaniclastic sediments; gradational contacts.

<<Vein: 50.3 - 52.5 10% Quartz-Sulphide 75 deg. >> Pyrite-quartz stringers, foliaform

<<Struc: 51.2 - 51.21 dominant foliation>> Foliation weakly marked

54.40 59.05 RHYcw Curdy textured-flow banded coherent rhyolite (flows, subvolcanics)

54.4 - 59.05: Light grey, poorly developed curdy texture, probably crystals and lapilli fragments strained and deformed-poorly sorted (reworked volcaniclastic sediments), rare silicic bands; secondary foliation and crenulation cleavage locally observed; gradational contacts.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

59.05 74.18 RHYv Undifferentiated Rhyolite volcaniclastic

59.05 - 74.18: Medium grey, fine grained matrix, crystal fragments or clast-medium strained, poorly sorted, foliated; locally silicic wavy bands; sericite-quartz-ankerite replacing clasts; pyrite stringers associated with grey glassy quartz bands, patchy po; probably reworked volcaniclastic sediments; gradational contacts.

<<Struc: 64.35 - 64.36 Foliation>> Secondary foliation (2 foliations well marked, crenulation cleavage)

<<Struc: 64.4 - 64.41 Foliation>> Primary foliation (2 foliations well marked)

<<Struc: 66.3 - 66.45 Weak Fault>> Minor fault gouge

<<Struc: 70.5 - 70.51 Foliation>> Foliation poorly marked

74.18 76.90 RHYcw Curdy textured-flow banded coherent rhyolite (flows, subvolcanics)

74.18 - 76.9: Light grey, poorly developed curdy texture, possibly feldspar porphyries or crystal fragments; secondary foliation and crenulation cleavage; rare silicic wavy bands; gradational contacts.

<<Vein: 74.8 - 75.7 2% Carbonate-Biotite 5 deg. >> Unusual calcite-black mica veinlet without envelop, late, non-deformed

<<Struc: 76.35 - 76.36 Foliation>> Secondary foliation, curdy texture poorly developed

76.90 79.80 RHYv Undifferentiated Rhyolite volcaniclastic

76.9 - 79.8: Medium grey, fine grained matrix, crystal fragments or clast-medium strained, poorly sorted, foliated; locally silicic wavy bands; sericite-quartz-ankerite replacing clasts; pyrite stringers associated with grey glassy quartz bands, patchy po; probably reworked volcaniclastic sediments; gradational contacts.

79.80 112.68 RHYc Undifferentiated coherant rhyolite

79.8 - 112.68: Medium grey, medium to coarse grained matrix, texture locally obscured by secondary foliation showing weak sericitization and poorly developed crenulation cleavage (probably reworked epispastic sediments intervals and poorly developed curdy texture); quartz-sericite; py-po patches associated with grey glassy quartz bands, trace sphalerite-galena; gradational contacts.

<<Min: 87.6 - 88 2% Min: Sphalerite>>

<<Min: 92.1 - 92.3 0.5% Min: Sphalerite>>

<<Min: 92.1 - 92.3 0.1% Min: Galena>> Associated with sphalerite

<<Min: 112 - 124.16 1% Min: Pyrite>>

<<Min: 112 - 124.16 2% Min: Pyrrhotite>>

<<Struc: 92.8 - 92.81 Foliation>> Secondary foliation, weakly developed

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 94 - 95.35 Moderate-Strong Fault>> 60% clay-30% sandy-silt fault gouge over 1.30 m;

<<Struc: 103.3 - 103.31 Foliation>> Late secondary foliation, crenulation cleavage

<<Struc: 104 - 104.1 Weak Fault>> Minor fault gouge

<<Struc: 110.25 - 110.26 dominant foliation>> Possibly well marked secondary foliation

<<Struc: 112.2 - 112.21 dominant foliation>>

112.68 117.26 MDSc Carbonaceous dominant mudstone

112.68 - 117.26: Grey-dark blue, medium grained, well foliated, secondary foliation weakly marked; quartz-sericite-graphite; locally faulted (80% clay over 20 cm); elongated disseminated po, rare py; gradational contacts.

<<Struc: 116.72 - 117.2 Weak-Moderate Fault>> Fault (30% clay) gouge over 10 cm

117.26 124.16 MDSw Coherent rhyolite flow with carbonaceous content

117.26 - 124.16: Medium grey-dark blue; medium to coarse grained, foliated; locally wavy-deformed foliation or flow bands; quartz-sericite-graphite; disseminated po, rare py; gradational contacts.

<<Struc: 118.7 - 118.71 Foliation>> Possibly 2 foliations marked

<<Struc: 122.3 - 122.31 Foliation>>

124.16 140.57 RHYc Undifferentiated coherant rhyolite

124.16 - 140.57: Pale grey-light yellow-green, medium to coarse grained, foliated, quartz-sericite-muscovite; moderately muscovite altered, patchy po, patchy and disseminated py; massive quartz vein showing locally strongly muscovite altered envelop; locally less altered patch-grey sericite-crenulation cleavage and py in primary foliation,; gradational contacts.

<<Min: 124.16 - 136 5% Min: Pyrite>>

<<Min: 124.16 - 136 2% Min: Pyrrhotite>>

<<Min: 136 - 144.6 3% Min: Pyrite>>

<<Min: 136 - 144.6 2% Min: Pyrrhotite>>

<<Min: 140 - 144.6 0.1% Min: Galena>>

<<Alt: 124.16 - 130.26 Moderate-Strong Muscovite>>

<<Alt: 130.26 - 141.58 Moderate Muscovite>>

<<Vein: 131.4 - 136.5 20% Quartz>> Multiple massive quartz, glassy-fractured, muscovite alteration halo

<<Vein: 138.33 - 138.34 90% Quartz-Carbonate 25 deg. >> Dolomite-quartz veinlet crosscutting the foliation

<<Struc: 124.2 - 124.21 dominant foliation>>

<<Struc: 130.1 - 130.11 dominant foliation>>

From (m)	To (m)	Rocktype & Description		From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
<<Struc: 133.65 - 133.66 dominant foliation>>												
<<Struc: 135.8 - 136 Weak Fault>>		Minor fault gouge (muscovite rich) at contact with massive quartz vein										
140.57	**141.58**	**MDSw** **Coherent rhyolite flow with carbonaceous content**										
140.57 - 141.58: Grey-silvery, medium to coarse grained, black thin bands-foliated, crenulation cleavage weakly developed; quartz-sericite-lesser graphite; disseminated py; gradational contacts.												
141.58	**144.60**	**RHYc** **Undifferentiated coherant rhyolite**										
141.58 - 144.6: Light grey, texture obscured by muscovite alteration (bleached), foliated; quartz-sericite-muscovite; py-po patches; gradational lower contact marked by chlorite alteration												
<<Min: 143.5 - 144.6 0.1% Min: Arsenopyrite>>

0.00 6.70 OVBN Overburden

6.70 7.69 RHYv Undifferentiated Rhyolite volcaniclastic

6.7 - 7.69: Medium grey highly siliceous felsic with a moderate foliation. Wispy bands of muscovite and biotite (roughly concordant with foliation) spaced between ovular to rounded siliceous blebs (clasts?). Possible it's a strong siliceous overprint of MAFt.

<<Min: 6.7 - 7.69 0.1% Min: Pyrite>> Also contains minor pyrrhotite.

<<Alt: 6.7 - 11.12 Weak Calcite>> Calcite present throughout the hole, primarily in the form of bands (also containing quartz) and trace amounts can be found in the matrix of the MAFt unit.

<<Vein: 6.7 - 11.12 7% Quartz-Carbonate 60 deg. >>

7.69 11.12 MAFt Undifferentiated mafic volcaniclastic

7.69 - 11.12: Fine-grained weakly chloritic volcaniclastic. Weak to moderately foliated with irregular quartz-calcite veins 1 mm to 20 cm concordant or discordant to the foliation (some are also discontinuous). Two tourmaline-calcite-bioite-quartz veins present, a 20 cm vein at 10 m depth and a 5 cm vein at 11 m depth.

<<Min: 7.69 - 11.12 0.1% Min: Pyrrhotite>> Also contains minor pyrite.

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
Comments:						Parent Hole:	

K17-452 drilled for geotechnical characteristics of the proposed mill site. The top 6.1 m was collected for sonic overburden testing while the rest of the hole is comprised of intercalated mafic volcaniclastics and mudstone of the Wind Lake Formation. PVC installed to conduct downhole seismic surveys.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0			PLND-LiDAR	Knight Piésold			☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
0.00	**6.10**	**OVBN** **Overburden**									
6.10	**10.26**	**MAFt** **Undifferentiated mafic volcaniclastic**									

6.1 - 10.26: Foliated highly calcareous metased with elongated calcite-lapilli clasts (containing pressure shadows) concordant to foliation. Medium grey in colour and while absent of chlorite the unit is dominated by a calcite overprint. Calcite is in the form of lapilli (clast-replacement), bands, veins (with quartz), and in matrix. Minor biotite (< 1mm crystals) present in strings concordant with foliation.

<<Alt: 6.1 - 10.26 Moderate Calcite>> Dominantly in bands & replaced clasts, also occurs in matrix and qz-ca veins.

<<Vein: 6.7 - 21.71 5% Quartz-Carbonate 65 deg. >> Vein set consisting primarily of veins 1 mm to 2 cm but also contains smallers veinlets (< 1 mm) and massive veins > 10 cm. Veins are concordant with foliation/laminations in the MAFt and MDS units but can also be discordant.

<<Struc: 7.65 - 7.66 Moderate Foliation>> Calcite band

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

10.26 11.62 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

10.26 - 11.62: Dark grey laminated mudstone with calcite bands and quartz-calcite veins (< 3 cm) concordant with the foliation.

<<Alt: 10.26 - 40.53 Weak-Moderate Calcite>> Occurs in bands, in matrix/laminations, and in qz-ca veins.

11.62 12.77 MAFt Undifferentiated mafic volcaniclastic

11.62 - 12.77: Fine-grained weakly chloritic volcaniclastic with irregular quartz-calcite veining. Non-foliated.

12.77 13.82 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

12.77 - 13.82: Dark grey laminated mudstone. Contains two foliations, one at 55 degrees which adheres to the laminations, and one at 80 degrees which contains parallel quartz-calcite veins. Contains biotite overprint of 1 mm crystals for 1% of the mode. Upper contact is faulted material while lower contact gradationally transitions in the MAFt unit.

13.82 16.33 MAFt Undifferentiated mafic volcaniclastic

13.82 - 16.33: Weakly chloritic fine-grained volcaniclastic. Moderately foliated with (mostly) concordant quartz-calcite veins < 1 cm. Massive 20 cm quartz-tourmaline vein at 15.1 m depth with 40 cm quartz-muscovite altered margins. 1 mm biotite overprint accounts for 1% of the mode.

<<Min: 14.68 - 19.84 0.5% Min: Pyrrhotite>> Commonly associated with calcite mineralization.

<<Alt: 14.68 - 15.03 Moderate-Strong Muscovite>> Gradational margin of white-mica + silification proximal to a massive quartz-tourmaline vein (intensifies with depth).

<<Alt: 15.34 - 15.84 Moderate-Strong Muscovite>> Gradational margin of white-mica + silification proximal to a massive quartz-tourmaline vein (intensity decreases with depth).

<<Struc: 16.16 - 16.17 Moderate Foliation>> Calcite band

16.33 19.84 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

16.33 - 19.84: Dark grey laminated mudstone with minorly deformed concordant calcite bands. Speckled biotite (1mm) accounts for 1% of the mode.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

19.84 22.46 MAFt Undifferentiated mafic volcaniclastic

19.84 - 22.46: Chloritic fine-grained volcaniclastic with a weak-moderate foliation. From the top of the interval to 21.7m depth is characterized by a homogenous unit with quartz-calcite veins concordant with the foliation. The rest of the interval is dominated by massive irregular quartz-calcite-chlorite veins to the lower contact. Both sections contain 1-2 mm calcite blebs, but don't appear to be stretched clasts akin to the MAFt unit at the top of the hole. The upper contact with the MDS unit is sharp.

<<Vein: 21.71 - 36.22 15% Quarzt-Chlorite-Carbonate>> Predominately irregular discordant quartz-calcite-chlorite with nearly equal quartz to calcite and typically <10 % chlorite.

22.46 36.22 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

22.46 - 36.22: Dark grey to black laminated mudstone with a high density of massive quartz-calcite-chlorite veins and local deformation. Calcite bands are present and are also deformed locally with the muddy/carbonaceous laminae. Some deformed sections contains small (mm scale) fractures which are commonly infilled with pyrite or pyrrhotite. Some sections of highly carbonaceous mudstone that contain a higher % of disseminated pyrite/pyrrhotite in lithology.

<<Min: 22.46 - 36.22 1% Min: Pyrrhotite>> Local patches/aggregates of up to 5%. Commonly associated with calcite mineralization.

<<Struc: 22.76 - 22.77 Moderate Foliation>> Calcite band

<<Struc: 32.68 - 35.69 Trace Fault>> Interval with zones containing brittle material with minor gouge separated by zones of competent rock.

36.22 40.53 MAFt Undifferentiated mafic volcaniclastic

36.22 - 40.53: Chloritic fine-grained volcaniclastic with a moderate foliation. Quartz-Calcite bands < 1 cm concordant with the foliaton are present throughout the unit as well as larger irregular quartz-calcite veins. Speckled biotite 1-2 mm is occurs as 1% of the mode.

<<Vein: 36.22 - 40.53 7% Quartz-Carbonate 70 deg. >> Range in size from 1 mm to 5 cm and are typically concordant with the foliation.

<<Struc: 40.19 - 40.2 Moderate Foliation>> Calcite band

Comments:						Parent Hole:	

K17-453 drilled for geotechincal characteristics over the proposed mill site. The hole encountered intercalated mafic volcaniclastics and mudstones from the Wind Lake Formation.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0			PLND-LiDAR	Knight Piésold			☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 2.30 OVBN Overburden

2.30 4.17 MAFt Undifferentiated mafic volcaniclastic

2.3 - 4.17: Fine-grained chloritic volcaniclastic. Abundant calcite in matrix (overprint) and contains a 2 cm deformed quartz-calcite with chevron folding. The calcite also occurs in bands that can exibit gentle folding (decimeter scale wavelength).

<<Min: 2.3 - 6.51 0.1% Min: Pyrrhotite>>

<<Alt: 2.3 - 11.3 Weak-Moderate Calcite>>

<<Vein: 2.3 - 11.3 2% Quartz-Carbonate>> Quartz-calcite veins typically < 1 cm in all units. Abundance varies throughout the hole as veins most often occur in clusters. Many veins are minorly deformed with the exception of a 2 cm vein at the top of the hole (~3.1 m depth) that is strongly deformed with chevron folds.

4.17 5.38 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

4.17 - 5.38: Dark grey laminated mudstone with quartz-calcite veins. Quartz veins don't conform to the same angle to the core axis as the foliation is not well established. Upper and lower contacts with MAFt are gradational and contains intermixed chloritic and carbonaceous material.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

5.38 7.31 MAFt Undifferentiated mafic volcaniclastic

5.38 - 7.31: Light-grey fine-grained chloritic volcaniclastic. Contains abundant calcite in groundmass and irregular quartz-calcite veins up to 1.5 cm. Very weak foliation is present.

<<Min: 6.51 - 7.01 1% Min: Pyrrhotite>>

<<Min: 7.01 - 11.3 0.1% Min: Pyrite>>

<<Struc: 5.63 - 5.64 Weak Foliation>> Calcite band

7.31 8.69 MAFt Undifferentiated mafic volcaniclastic

7.31 - 8.69: Chloritic weakly foliated volcaniclastic with equigranular 1 mm biotite and calcite crystals throughout the interval (groundmass is chlorite dominated). Textural changes between overlying and underlying MAFt are gradational.

<<Struc: 7.37 - 7.38 Weak Foliation>>

8.69 11.30 MAFt Undifferentiated mafic volcaniclastic

8.69 - 11.3: Light-grey fine-grained chloritic volcaniclastic. Relatively absent of quartz-calcite veins although few exist up to 1 cm. Speckled biotite (overprint) < 1 mm present at varying modes throughout the interval but overall accounts for 1%.

End of Hole @ 11.3

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
Comments:						Parent Hole:	

K17-454 drilled for geotechnical characteristics over the proposed mill site. The hole encountered intercalated mafic volcaniclastics and mudstones from the Wind Lake Formation. An interval containing sphalerite mineralization within a Quartz-Calcite vein from 5.47 to 6.16 m depth was sampled.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0			PLND-LiDAR	Knight Piésold			☑	

From (m)	To (m)	Rocktype & Description
0.00	**5.47**	**OVBN** **Overburden**
5.47	**7.15**	**MAFt** **Undifferentiated mafic volcaniclastic**

From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
5.47	6.16	0.69						

5.47 - 7.15: Fine-grained chloritic volcaniclastic with abundant fracturing and massive irregular quartz-calcite-sulphide veins. Significant mineralization of sphalerite (with minor galena) occurs as 0.5 to 2 cm lenses/patches in quartz-calcite veins from 5.59 to 5.85 m depth.

<<Min: 5.63 - 5.84 5% Min: Sphalerite>> Irregular sphalerite patches/aggregates from 1 mm to 1.5 cm hosted within massive quartz-calcite veins. Three different local aggregates/concentration of sphalerite mineralization within the interval.

<<Min: 5.84 - 7.15 0.5% Min: Pyrite>>

<<Alt: 5.47 - 11.19 Weak-Moderate Calcite>> Calcite occuring in matrix (pervasive) as well as in bands. Inconsistent throughout the hole but present in all units. More intense in MAFt units.

<<Vein: 5.47 - 11.19 20% Quartz-Carbonate-Sulphide>> Massive veins prevalent throughout the hole that is predominately quartz-calcite and some containing sulphides and chlorite. Sulphide mineralization is typically pyrite but also includes sphalerite mineralization in the upper portion of the hole.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

7.15 9.69 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

7.15 - 9.69: Dark grey to black laminated mudstone. Massive irregular quartz-calcite veins are abundant throughout the interval as well as cross-cutting healed fractures (< 2 mm) filled with pyrite. Some veins contain pyrite lenses/patches up to 1.5 cm width. Carbonaceous mudstone from 7.90 to 8.53 m has quartz-filled blebs that are potentially amygdules.

<<Min: 7.15 - 7.39 3% Min: Pyrite>> Irregular cm scale clusters/aggregates cross-cutting massive veins and lithology

<<Min: 7.39 - 11.19 1% Min: Pyrite>> Fracture-fill and in bands/veins.

<<Vein: 7.65 - 8.5 0.1% Pyrite>> Pyrite stringers discordant and cross-cutting all lithologies and veins.

<<Struc: 7.65 - 7.66 Weak-Moderate Foliation>> Calcite band.

<<Struc: 8.09 - 8.1 Weak-Moderate Foliation>> Calcite band

9.69 10.01 MAFt **Undifferentiated mafic volcaniclastic**

9.69 - 10.01: Chloritic fine-grained volcaniclastic with weak foliation and containing quartz-calcite veins & veinlets. Upper contact is dominated by veining while lower contact is faulted.

10.01 11.19 MDS **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**

10.01 - 11.19: Dark grey laminated mudstone. Interval is dominated by faulted material and massive quartz-calcite veining which has deformed the mudstone. Generally the massive veins are competent while the mudstone is fractured/rubble.

<<Struc: 10.01 - 11 Weak Fault>> Faulted interval with zones of highly fractured & gouged material separated by zones of competent rock.

End of Hole @ 11.19

Comments:						Parent Hole:	

K17-457 drilled for geotechnical characteristics over the proposed mill site. The hole encountered intercalated mudstone/siltstone and mafic volcaniclastics of the Wind Lake Formation.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0			PLND-LiDAR	Knight Piésold			☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
0.00	**5.29**	**OVBN** **Overburden**									
5.29	**6.08**	**MDS** **Undifferentiated carbonaceous mudstone & tuffaceous mudstone**									

5.29 - 6.08: Dark laminated mudstone with deformed quartz-calcite-pyrrhotite veins and a massive quartz-calcite vein. Sharp sawtooth contact with underlying silty/wacke unit.

<<Min: 5.29 - 8.68 2% Min: Pyrrhotite>> Pyrrhotite in the form of isolated lenses (1 mm to 1 cm wide) as well as continuous veins associated with quartz-calcite veining.

<<Alt: 5.29 - 11.29 Weak-Moderate Calcite>> Calcite alteraton throughout the hole in the form of bands, blebs, veins, and pervasive sections. Calcite mode in pervasive sections can reach up to 80% of the rock.

<<Vein: 5.29 - 11.29 2% Quartz-Carbonate 70 deg. >> Irregular quartz-calcite veins similarily orientated to the core axis with slight deviations. Veins are 1 mm to 4 cm wide with the exception of an massive discordant vein at the top of the hole in the mudstone. Discordant stringer veins also occur.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

6.08 8.68 WCK Wacke - sandstone with 15-75% clay matrix

6.08 - 8.68: Grey very fine-grained sedimentary unit. No visible sedimentary textures/structures but contains quartz-calcite veining/banding and abundant pyrrhotite lenses. Upper contact with mudstone is sharp (saw-toothed) while lower contact is gradational to the chloritic volcaniclastic.

<<Alt: 8 - 8.29 Weak-Moderate Silicification>> Interval of silification containing deformed bands of calcite, pyrrhotite, and the silicified wacke lithology.

<<Struc: 7.78 - 7.79 Weak Foliation>>

8.68 11.29 MAFt Undifferentiated mafic volcaniclastic

8.68 - 11.29: Fine-grained chloritic calcareous volcaniclastic. Calcite is abundant in groundmass and as 1-3 mm blebs throughout the hole. Quartz-calcite veins are predominately irregular but have a similar angle to the core axis that follows a weak foliation. Speckled biotite 1-2 mm acounts for 0.5% of the mode.

<<Min: 8.68 - 11.29 0.5% Min: Pyrrhotite>> Disseminated pyrrhotite < 2 mm in lithology as well as vein mineralization with quartz and calcite.

<<Alt: 11.16 - 11.29 Weak Silicification>> Silicification of lithology.

<<Struc: 9.98 - 9.99 Weak Foliation>>

End of Hole @ 11.29

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
Comments:						Parent Hole:	

K17-458 drilled for geotechnical characteristics over the proposed mill site. The hole encountered intercalated mafic volcaniclastics and mudstone of the Wind Lake Formation and contains minor base metals mineralization. PVC installed for downhole seismic surveys.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0			PLND-LiDAR	Knight Piésold			☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 3.00 OVBN Overburden

3.00 30.14 MAFt Undifferentiated mafic volcaniclastic

3 - 30.14: Fine-grained chloritic volcaniclastic with variable textures and weakly foliated. Colour varies from a pale green to darker greyish-green but invariably contains chlorite. Calcite occurs as blebs, bands, and in groundmass at variable modes up to a total of 50% of the rock in given sections. Quartz-Calcite-(Sulphide) veins 1 mm to 8 cm occur throughout as irregular and discordant veins with some minor veins concordant to the weak foliation. Speckled biotite crystals 1-2 mm are present throughout the unit at variable modes from 1-25% in given sections. Lower contact with mudstone is faulted.

<<Min: 3 - 30.14 0.5% Min: Pyrrhotite>> Pyrrhotite (with minor pyrite) mineralization within quartz-calcite veins.

<<Alt: 3 - 41.3 Weak-Moderate Calcite>> Calcite alteration in the form of bands, blebs, veins, and in matrix of chloritic volcaniclastics. Variable intensity from moderate to trace alteration.

<<Alt: 3.18 - 3.55 Weak Silicification>> Silification with no proximal massive quartz veins.

<<Alt: 4.61 - 4.74 Weak Silicification>> Silification with no proximal massive quartz veins.

<<Alt: 19.23 - 20.39 Weak-Moderate Silicification>> Silification of chloritic volcaniclastic giving it a pale grey colour. Intensity gradationally intensifies towards the centre of the interval. No massive quartz veins nearby by contains minor (< 0.5 cm) veins within, as consistent with the rest of the hole.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 3 - 41.3 2% Quartz-Carbonate>> Quartz-calcite veins concordant with the foliation/laminations but can also occur discordant.

<<Vein: 27.44 - 35.65 Quartz-Pyrite>> Fracture-fill stringer veinlets of pyrite +/- quartz cross-cutting all lithologies and structures and in some cases has becciated the hostrock. Globs of coarse pyrite occurs in mudstone unit

<<Struc: 8.55 - 8.56 Weak Foliation>>

<<Struc: 10.9 - 10.95 Weak Fault>> Gouged and brecciated zone surrounded by competent rock.

<<Struc: 11.55 - 11.56 Weak Foliation>>

<<Struc: 26.78 - 26.79 Weak Foliation>>

<<Struc: 28.98 - 30.3 Weak Fault>> Fault zone with gouged sections surrounded by highly fractured rock.

30.14 35.65 MDSc Carbonaceous dominant mudstone

30.14 - 35.65: Dark grey to black laminated carbonaceous mudstone with abundant sulphide (pyrite and/or pyrrhotite) veining. Silty beds & laminations are present up to 22 cm within the carbonaceous/muddy beds. Calcite banding and quartz-calcite-sulphide veins occurs concordant to the foliation, but the dominant veining is stringy/irregular veins cross-cutting all lithologies and veins, and in larger veins has brecciated the host rock. Sulphides and calcite also occurs in blebs/patches.

<<Min: 30.14 - 35.65 5% Min: Pyrite>>

<<Struc: 31.97 - 32.15 Weak-Moderate Fault>> Gouged and brecciated zone. Competent surrounding rock.

<<Struc: 33.17 - 33.26 Weak Fault>> Gouged and brecciated zone surrounded by competent rock.

<<Struc: 34.2 - 34.21 Weak Foliation>>

35.65 41.30 MAFt Undifferentiated mafic volcaniclastic

35.65 - 41.3: Fine-grained chloritic volcaniclastic. Weak-moderate foliation with abundant quartz-calcite-(sulphide) veining occuring concordantly (regular veins) or discordantly (irregular veins). Larger (> 0.5 cm)pyrrhotite veins associated with qz-ca veins can contain minor amounts of chalcopyrite, while one vein contains chalcopyrite and sphalerite (~5% of the 2 cm vein) at 39.56 m depth. The upper 20 cm of the unit contains mudstone laminations and potentially clasts as it transitioned from the MDSc to MAFt unit.

<<Min: 35.65 - 41.3 0.1% Min: Chalcopyrite>> Chalcopyrite mineralization in < 1 cm clusters within quartz-calcite-pyrrhotite veins. 5 occurences of chalcopyrite within these veins.

<<Min: 39.55 - 39.6 5% Min: Sphalerite>> Sphalerite mineralization within a pyrrhotite-quartz-calcite vein. Also contains chalcopyrite.

<<Struc: 41.09 - 41.1 Weak Foliation>>

End of Hole @ 41.3

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 2.90 OVBN Overburden

<<Vein: 0 - 13.63 3% Quartz-Carbonate>> Quartz-calcite veins, predominately irregular and concordant with the foliation but also occurs discordantly.

2.90 24.66 MAFt Undifferentiated mafic volcaniclastic

2.9 - 24.66: Fine-grained chloritic volcaniclastic with quartz+calcite replaced lapilli. The unit is weakly foliated and contains regular quartz-calcite veins concordant with the foliation. Elongated (teardrop) lapilli 0.1 to 1.5 cm are present in certain sections (0.3 to 2 m each) and are absent in the rest of the interval. 1 mm ankerite present from 11 m to 13.4 m depth for 2% of the mode in the given section. A section of massive quartz-calcite-tourmaline veining and faulting/fracturing is present from 13.15 to 18.8 m depth.

<<Alt: 2.9 - 41.3 Weak-Moderate Calcite>> Trace to moderate calcite alteration throughout the hole in the form of bands, clast-replacement, and in groundmass of the chloritic volcaniclastics.

<<Vein: 13.63 - 16.68 30% Quartz-Tourmaline>> Massive quartz-tourmaline veins, some containing pyrite, chlorite, and rip-ups of host lithology.

<<Vein: 16.68 - 24.66 3% Quartz-Carbonate 60 deg. >> Quartz-calcite veins primarily concordant with some discordant (10% of veins).

<<Struc: 8.67 - 8.86 Weak Fault>> Brecciated + gouged zone. Low angle to core axis (~20 degrees).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 12.27 - 12.28 Weak Foliation>> Calcite band

<<Struc: 13.33 - 14.86 Trace Fault>> Faukt zone of gouged+brecciated material with intervals of competent rock. Lower 36 cm of interval is lithified fault breccia (re-worked fault).

<<Struc: 18.39 - 18.8 Weak-Moderate Fault>> Gouge zone.

<<Struc: 20.53 - 20.54 Weak Foliation>>

24.66 25.54 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

24.66 - 25.54: Dark grey laminated mudstone with calcite banding and pyrite veins. Pyrite is found in quartz-calcite veins and as stringy fracture-fill veinlets. The unit is intermixed with the chloritic volcaniclastics and the upper & lower contacts ate gradational.

<<Min: 24.66 - 25.54 2% Min: Pyrite>>

<<Vein: 24.66 - 25.54 3% Quartz-Carbonate-Sulphide>> Deformed pyrrhotite-quartz-calcite veins < 1 cm, continuous or discontinuous in core.

25.54 26.62 MAFt Undifferentiated mafic volcaniclastic

25.54 - 26.62: Fine-grained chloritic volcaniclastic. Weakly foliated with concordant quartz-calcite veins (some folded) and discordant pyrite veins cross-cutting the quartz-calcite veins. Upper & lower contacts with mudstone are gradational.

<<Min: 25.54 - 26.62 0.5% Min: Pyrite>>

<<Vein: 25.54 - 26.62 2% Quartz-Carbonate 70 deg. >> Quartz-calcite veins < 1 cm concordant with the foliation.

26.62 29.00 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

26.62 - 29: Dark grey to black laminated carbonaceous mudstone with pyrrhotite-quartz-calcite veining. Moderate foliation established with calcite banding and the po-qz-ca veins (70 degrees TCA) however the foliation is discordant from the mudstone laminations (35 degrees TCA). Chloritic unit bound by quartz-calcite veins from 27.42 to 27.57 m depth.

<<Min: 26.62 - 29 4% Min: Pyrrhotite>>

<<Vein: 26.62 - 29 5% Quartz-Carbonate-Sulphide 65 deg. >> Deformed pyrrhotite-quartz-calcite veins < 1 cm, continuous or discontinuous in core.

<<Struc: 28.27 - 28.28 Weak Foliation>>

<<Struc: 28.29 - 28.3 Moderate Bedding>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
29.00	**41.30**	**MAFt** **Undifferentiated mafic volcaniclastic**									

29 - 41.3: Fine-grained chloritic volcaniclastic. Irregular quartz-calcite-(sulphide) veining occurs throughout and is concordant with a weak foliation. No convincing lapilli clasts in contrast to the uppermost (22 m) MAFt unit. Beds of mudstone up to 14 cm present in the lowermost 2 m of the interval. Pepper-textured 1 mm biotite accounts for < 1 % of the mode.

<<Min: 29 - 41.3 0.5% Min: Pyrrhotite>>

<<Min: 34.76 - 35 0.5% Min: Sphalerite>> Sphalerite mineralization within two irregular pyrrhotite-quartz-calcite veins.

<<Vein: 29 - 41.3 3% Quartz-Carbonate 70 deg. >> Quartz-calcite veins, predominately irregular and concordant with the foliation but also occurs discordantly.

<<Struc: 38.3 - 38.4 Weak Foliation>>

End of Hole @ 41.3

Comments:

K17-459 drilled for geotechnical characteristics over the proposed mill site. The hole encountered intercalated mafic volcaniclastics and mudstone of the Wind Lake Formation and contains minor base metals mineralization. PVC installed for downhole seismic surveys.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0			PLND-LiDAR	Knight Piésold			☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
0.00	**3.05**	**OVBN**	**Overburden**									
3.05	**24.75**	**MAFt**	**Undifferentiated mafic volcaniclastic**									

3.05 - 24.75: Fine-grained chloritic volcaniclastic with a weak foliation. The unit invariably contains chlorite in groundmass however other mineralogies (i.e. carbonates, biotite, sulphides) are variable. Calcite occurs as groundmass, bands, blebs, and in quartz-calcite veins. Biotite primarily occurs as overprint in the form speckled 1-2 mm crystals but is also found in veins. Sulphides (primarily Pyrrhotite) are found in veins and disseminated in lithology (<1% of mode). 1 mm crystals of Ankerite present in the upper portions of the hole above the massive quartz-calcite vein at 8.6 m (1% of mode in this section). Colour of the unit ranges from dark green to pale grey depending on the abundance of calcite in the groundmass.

<<Min: 3.05 - 24.75 0.1% Min: Pyrrhotite>> Pyrrhotite + Pyrite present in lithology (disseminated) and in veins.

<<Alt: 3.05 - 40.55 Weak-Moderate Calcite>> Calcite alteration in groundmass, blebs, bands, and veins.

<<Vein: 3.05 - 40.55 Quartz-Carbonate>> Discordant calcite veins that either have regular form (planar) or irregular (deformed). Majority of the veins are discordant however some concordant veins occur with an alpha angle TCA of 80-60.

<<Vein: 8.68 - 9.97 99% Quarzt-Chlorite-Carbonate>> Predominately quartz-calcite with patches (0.5 to 5 cm) of pyrrhotite and chlorite.

<<Struc: 10.03 - 10.16 Trace Fault>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 11.91 - 11.92 Weak Foliation>>

<<Struc: 19.74 - 19.75 Weak-Moderate Foliation>>

<<Struc: 23.05 - 24 Trace Fault>> Heavily fractured zone with little gouge.

24.75 25.17 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

24.75 - 25.17: Dark grey mudstone with stringy calcite-pyrite veins. Gradational upper & lower contacts.

<<Min: 24.75 - 25.17 2% Min: Pyrrhotite>> Increase in sulphide abundance in the mudstone unit.

25.17 40.55 MAFt Undifferentiated mafic volcaniclastic

25.17 - 40.55: Fine-grained chloritic volcaniclastic. Dark green to medium grey depending on the abundance of calcite. Similar characteristics to the upper MAFt unit in terms of texture variation & mineralogical characteristics. Sections up to 0.5 m containing calcite blebs (potentially replaced lapilli) are present between 35 to 38 m depth. Sphalerite and chalcopyrite mineralization present in thin (< 1.5 cm) veins with calcite +/- pyrrhotite.

<<Min: 25.17 - 40.55 0.1% Min: Pyrite>> Pyrite in veins, pyrrhotite mineralization as well in wispy vein aggregates. Minor chalcopyrite mineralization in larger pyrrhotite aggregrates.

<<Min: 31.74 - 31.87 1% Min: Sphalerite>> Sphalerite in 3 mm veins with calcite.

<<Min: 37.81 - 37.83 5% Min: Sphalerite>> 2 mm veinlet containing sphalerite.

<<Alt: 27.76 - 27.94 Weak Silicification>>

<<Alt: 30.24 - 30.48 Weak Silicification>>

<<Struc: 26.39 - 26.51 Trace Fault>> Highly fractured zone with minor clay.

<<Struc: 27.35 - 27.44 Trace Fault>> Highly fractured zone with minor clay.

<<Struc: 31.85 - 31.86 Weak Foliation>> Concordant sphalerite-calcite vein.

<<Struc: 37.95 - 37.96 Weak-Moderate Foliation>> Calcite band

K17-461 drilled for geotechnical characteristics over the proposed mill site. The hole encountered intercalated mafic volcaniclastics and mudstone of the Wind Lake Formation.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0			PLND-LiDAR	Knight Piésold			☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 4.57 OVBN Overburden

4.57 5.81 MAFt Undifferentiated mafic volcaniclastic

4.57 - 5.81: Fine-grained chloritic volcaniclastic with elongated calcite clasts. The unit is reversely graded as lapilli decreases in width from 1 cm to 3 mm from the top to the bottom of the interval

<<Min: 4.57 - 5.81 0.1% Min: Pyrrhotite>>

<<Alt: 4.57 - 42.8 Weak-Moderate Calcite>> Calcite overprint in the form of blebs, bands, and lapilli. Calcite veins (with quartz and/or sulphides) also present.

<<Vein: 4.57 - 42.8 3% Quartz-Carbonate 75 deg. >> Quartz-calcite veins typically 1 mm to 1 cm concordant wth the foliation. Massive veins up to 9 cm are rare.

5.81 7.95 MDSc Carbonaceous dominant mudstone

5.81 - 7.95: Dark grey to black carbonaceous mudstones. Abundant pyrrhotite (4%) associated with calcite vein mineralization. Upper contact is sharp with a quartz-calcite vein while lower contact is gradational.

<<Min: 5.81 - 7.95 4% Min: Pyrrhotite>> Pyrrhotite-calcite veins.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 5.81 - 7.95 4% Carbonate-Sulphide 75 deg. >> Patchy/discontinuous/irregular veins contact predominately pyrrhotite with calcite and likely minor/trace quartz.

<<Struc: 7.18 - 7.19 Weak Foliation>> pyrrhotite-calcite vein.

<<Struc: 7.21 - 7.22 Moderate Bedding>> Mudstone lamination.

7.95 42.40 MAFt Undifferentiated mafic volcaniclastic

7.95 - 42.4: Fine-grained chloritic volcaniclastic with variable textures and modal mineralogy. Invariably contains chlorite in groundmass and often contains calcite blebs & veins (with quartz) and 1-3 mm biotite porpyhyroblasts as overprint. Lapilli are present in specific sections (typically < 1 m each) throughout the hole and contain a variable amount of lapilli. An interval with easily distinguishable lapilli exists from 11.23 to 12.23 m depth. Two beds of mudstone (9 cm and 17 cm) exist at 38.4 m depth with a sawtooth contact.

<<Alt: 30.91 - 31.81 Weak-Moderate Silicification>> Margins of silicification (bleaching) associated with a massive quartz vein. Margin above the vein is 40 cm while the bottom margin is 20 cm.

<<Vein: 31.33 - 31.74 Quartz-Carbonate-Sulphide>> Massive quartz-calcite-pyrite vein with bleached margins. 1 cm discordant tourmaline vein adjacent to the massiv vein.

<<Struc: 20.68 - 20.9 Trace Fault>>

<<Struc: 22.02 - 22.2 Trace Fault>>

<<Struc: 22.49 - 22.5 Moderate Foliation>>

<<Struc: 25.6 - 25.85 Moderate Fault>> Heavily gouged.

<<Struc: 27.66 - 27.67 Moderate Foliation>>

<<Struc: 29.63 - 29.72 Weak Fault>>

<<Struc: 35.67 - 35.93 Weak Fault>>

<<Struc: 40.99 - 41 Moderate Foliation>>

<<Struc: 42.2 - 42.52 Weak-Moderate Fault>>

42.40 42.80 MAFt Undifferentiated mafic volcaniclastic

42.4 - 42.8: Dark grey carbonaceous mudstone with quartz-calcite veining. Contact with upper MAFt is faulted.

End of Hole @ 42.8

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 3.80 OVBN Overburden

3.80 5.99 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

3.8 - 5.99: Laminated carbonaceous mudstone with calcareous bands. Lower contact with MAFt is sharp.

<<Min: 3.8 - 22.73 0.1% Min: Pyrite>> Pyrite in the discordant quartz-tourmaline-calcite veins.

<<Alt: 3.8 - 42.8 Weak-Moderate Calcite>> Bands, blebs, and clast-replacement. Calcite also found in veins often with quartz +/- sulphides.

<<Vein: 3.8 - 42.8 3% Quartz-Carbonate 70 deg. >> Quartz-calcite +/- sulphide +/- bioite veins typically 1 mm to 1 cm wide and concordant with foliation. In very weakly foliated MAFt the veins are more discordant.

<<Struc: 5 - 5.01 Moderate Foliation>>

5.99 22.73 MAFt Undifferentiated mafic volcaniclastic

5.99 - 22.73: Fine-grained chloritic volcaniclastic. Calcite present as bands, blebs, and in lapilli (elongated). The unit does not contain lapilli over the entire interval but rather in sections, most notably from 19.90 to 21.80 m depth.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 7.36 - 28.22 0.5% Quartz-Tourmaline 0 deg. >> < 1 cm Quartz-tourmaline-calcite-pyrite veins orientated along core axis.

<<Vein: 22.3 - 22.64 100% Quartz-Carbonate>> Contains brecciated inclusions of host rock along margins.

<<Struc: 7.19 - 7.34 Trace Fault>>

<<Struc: 20.8 - 20.81 Moderate Foliation>>

<<Struc: 21.85 - 22 Weak Fault>>

22.73 25.13 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

22.73 - 25.13: Laminated carbonaceous mudstone with calcite banding. Increase in pyrrhotite in contrast to the chloritic units present in calcite veins. Sharp upper & lower contacts with MAFt.

<<Min: 22.73 - 25.13 3% Min: Pyrrhotite>> Pyrrhotite in calcite veins/blebs.

25.13 41.89 MAFt Undifferentiated mafic volcaniclastic

25.13 - 41.89: Fine-grained chloritic volcaniclastic. Calcite present as bands, blebs, and in lapilli (elongated). The unit contains lapilli from 26.80 to 27.35 m depth. 1-2 mm speckled biotite crystals present but only in sections no greater than 1.5 m.

<<Min: 25.13 - 41.81 0.1% Min: Pyrite>> Pyrite in the discordant qz-tml-ca veins.

<<Min: 41.81 - 42.8 1% Min: Pyrite>> Discordant stringy pyrite veins & clusters.

<<Alt: 26.19 - 26.8 Weak-Moderate Silicification>> Silicification of lithology along the margins of a massive quartz-calcite-pyrrhotite vein.

<<Struc: 32.35 - 32.36 Moderate Foliation>>

<<Struc: 36.29 - 36.3 Moderate Foliation>>

<<Struc: 36.53 - 36.62 Weak Fault>> Breccia + gouge

<<Struc: 40.94 - 41.11 Moderate Fault>>

<<Struc: 41.75 - 42.43 Weak Fault>>

41.89 42.80 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

41.89 - 42.8: Laminated carbonaceous mudstone with quartz-calcite-pyrite veins. Contact with the upper MAFt unit is faulted.

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
						Parent Hole:	

Comments:

K17-463 drilled for geotechnical characteristics for the proposed mill site. The hole encountered mafic volcaniclastics of the Wind Lake Formation with a massive tourmaline vein orientated along the core axis and altering the host-rock.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0			PLND-LiDAR	Knight Piésold			☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 8.98 OVBN Overburden

<<Alt: 8.97 - 10.57 Weak-Moderate Silicification>> Silicification of lithlology proximal to the tourmaline vein.

<<Alt: 8.97 - 12.22 Weak-Moderate Albite>> Dark-purple wall-rock alteration by the tourmaline vein. Typically extends ~2 cm from the vein but can extend up to 4 cm. Biotite is present as overprint akin to the biotite in the unaltered rock. Potentially albite alteration however it was not confidently identified.

8.98 9.81 MAFt Undifferentiated mafic volcaniclastic

8.98 - 9.81: Fine-grained chloritic volcaniclastic. Massive tourmaline vein present throughout the unit orientated along the core axis, as is faulted in some section. The vein has bleached (altered) the lithology up to 4 cm from the vein into a dark-purple coloured mineral (albite alteration?). Contains large rounded quartz blobs, likely discontinuous quartz-veins/pods.

<<Min: 8.98 - 12.22 0.1% Min: Pyrite>> Minor clusters of pyrite associated with the tourmaline vein.

<<Alt: 8.98 - 12.22 Weak-Moderate Calcite>> Calcite in groundmass of the unaltered lithology (by the TML vein), in quartz-calcite pods/veins, and in lapilli.

<<Vein: 8.98 - 12.22 15% Tourmaline 5 deg. >> Massive tourmaline vein throughout the hole orientated along the core axis. Minor calcite and quartz component within the vein. The vein has altered the host rock to a dark-purple (potentially albite) assemblage up to 4 cm from the vein, and in some places has a white halo (2-4 mm from vein) of calcite surrounding the vein.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 8.98 - 12.22 5% Quartz-Carbonate 72 deg. >> Quartz-calcite veins and pods concordant with the foliation. Pods are irregularly shaped and can be loosely concordant or discordant, however some are evidently connected to the concordant veins.

<<Struc: 9.77 - 12.22 Weak Fault>> Faulting within the tourmaline vein, gouge present.

9.81 9.97 MAFt Undifferentiated mafic volcaniclastic

9.81 - 9.97: Clast-supported lapilli tuff (quartz-calcite lapilli), containing elongated and stacked lapilli up to 1.5 cm width. In between the lapilli is a glassy dark-brown crystal. In the minor amounts of groundmass (< 5% of the unit) chlorite and the purple-alteration from the tourmaline vein are present.

9.97 12.22 MAFt Undifferentiated mafic volcaniclastic

9.97 - 12.22: Fine-grained chloritic volcaniclastic. Continuation of the previous MAFt unit with the massive tourmaline vein present along the core axis and bleaching the host rock. Contains large rounded quartz blobs, likely discontinuous quartz-veins/pods.

Rock unaffected by the tourmaline vein looks like a characteristic MAFt from the Wind Lake formation, whereas it is fine-grained with a chloritic groundmass containing concordant quartz-calcite veins and calcite bands, as well as minor biotite overprint.

<<Struc: 12.08 - 12.09 Moderate Foliation>>

End of Hole @ 12.22

Comments:						Parent Hole:	

K17-464 drilled for geotechnical characteristics for the proposed mill site. The hole encountered intercalated mudstone and mafic volcaniclastics from the Wind Lake Formation as well as a heavily MU-SI altered interval at 28.7 m depth. PVC installed to conduct downhole seismic surveys.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0			PLND-LiDAR	Knight Piésold			☑	

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 4.69 OVBN Overburden

4.69 25.67 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

4.69 - 25.67: Dark grey to black laminated mudstone. Contains intermixed fine-grained chloritic volcaniclastic material as well as a few silty (lighter grey) laminations. High abundance of faulting throughout the unit with moderate or greater intensities. Concordant quartz-calcite veins are present.

<<Min: 4.69 - 40.39 0.1% Min: Pyrite>> Minor mineralization of pyrite in clusters and pyrrhotite disseminated or in veins (with quartz-calcite). Sulphide % slightly increases in mudstones.

<<Alt: 4.69 - 40.39 Weak-Moderate Calcite>> Calcite in veins and blebs.

<<Vein: 5.09 - 5.54 95% Quartz-Carbonate-Sericite>>

<<Vein: 5.54 - 28.74 5% Quartz-Carbonate 75 deg. >> Quartz-calcite veins primarily concordant with the foliation/laminations but also occurs discordantly.

<<Struc: 5.25 - 5.3 Moderate Fault>> Within massive vein.

<<Struc: 5.39 - 5.59 Strong Fault>> Clay gouge adjacent to massive quartz-calcite vein contact.

<<Struc: 6.85 - 6.86 Moderate Bedding>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 9.54 - 10.64 Moderate Fault>> Heavily brecciated and gouged zone.

<<Struc: 11.03 - 11.37 Weak-Moderate Fault>> Heavily brecciated and gouged.

<<Struc: 15.21 - 15.28 Moderate Fault>> Gouged and heavily brecciated

<<Struc: 16.17 - 16.18 Moderate Foliation>>

<<Struc: 16.58 - 16.86 Strong Fault>> Clay gouge with brecciated fragments.

<<Struc: 17.23 - 17.38 Strong Fault>> Almost entirely clay-gouged with minor fragments

<<Struc: 19.87 - 19.91 Strong Fault>> Clay gouge

<<Struc: 21.81 - 21.96 Moderate Fault>>

<<Struc: 22.65 - 23.18 Weak-Moderate Fault>>

<<Struc: 25.57 - 25.58 Moderate Bedding>>

25.67 27.13 MAFt Undifferentiated mafic volcaniclastic

25.67 - 27.13: Fine-grained chloritic volcaniclastic. Contains irregular quartz-calcite veins (no greater than 4 cm) and intermixed mudstone.

27.13 28.74 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

27.13 - 28.74: Dark grey to black laminated mudstone with intermixed chloritic volcaniclastics.

28.74 32.22 RHY undifferentiated rhyolite

28.74 - 32.22: Strongly foliated muscovite schist with foliations of sericite and quartz. Massive quartz-tourmaline-calcite-muscovite vein from 28.98 to 29.58 m with margins of muscovite alteration. The remainder of the unit is pervasively silicified (contains rounded quartz crystals) and sericite altered, and contains 1 mm white speckled crystals overprinted (not carbonate). Upper and lower contacts with mudstone are sharp and the upper contact is faulted. The unit is probably an alteration product (vein-related) that has completely replaced the protolith. Mudstone laminae appear at 31.96 m depth.

<<Alt: 28.74 - 28.98 Moderate Muscovite>> Margin of massive qz-ca-tml vein

<<Alt: 29.62 - 29.89 Moderate Muscovite>> Margin of massive qz-ca-tml vein

<<Alt: 30.09 - 30.79 Strong Muscovite>> Foliations of sericite with calcite-quartz foliations. Protolith indistinguishable.

<<Alt: 30.79 - 32.22 Weak-Moderate Silicification>> Quartz blebs & veins within the proximal alteration from the massive vein.

<<Alt: 30.79 - 32.22 Weak-Moderate Muscovite>> Sericite alteration, gradationally decreasing from the top of the interval to the bottom where there is a sharp contact with the underlying mudstone.

<<Vein: 28.98 - 29.63 99% Quartz-Carbonate-Sericite>> Massive vein (predominately quartz) that has altered the host rock.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 29.63 - 40.39 Quartz-Carbonate>> Quartz-calcite veins primarily concordant with the foliation/laminations but also occurs discordantly. Abundance decreases in the MDSc unit.

<<Struc: 28.74 - 28.9 Strong Fault>>

<<Struc: 28.75 - 28.89 Moderate-Strong Fault>>

<<Struc: 30.41 - 30.42 Strong Foliation>> Sericite/quartz foliations

32.22 37.10 MDSc Carbonaceous dominant mudstone

32.22 - 37.1: Black carbonaceous mudstone. Contains calcite blebs & discordant veins but the abundance is significantly less than other units. Massive quartz-calcite veins, 8 cm bed of MAFt are present.

<<Vein: 34.41 - 35.17 10% Quartz-Carbonate-Sericite>> Set of 3 massive veins.

37.10 39.24 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

37.1 - 39.24: Laminated mudstone with intermixed fine-grained chloritic volcaniclastic (MAFt). The mudstone is the predominant lithology however MAFt comprises of up to 40% of the interval in beds between 1 cm to 27 cm. Calcite is abundant in concordant & discordant veins and blebs.

<<Struc: 37.26 - 37.27 Moderate Foliation>>

39.24 40.39 MDS Undifferentiated carbonaceous mudstone & tuffaceous mudstone

39.24 - 40.39: Dark grey laminated mudstone with abundant quartz-calcite veins. Increase in sulphide mineralization (pyrrhotite) relative to the overlying unit at about 1% of the mode.

End of Hole @ 40.39

Appendix S: Drill Core Certificates of Analysis

This appendix contains all of the certificates of analysis (COA) pertaining to geotechnical, hydrogeological, and exploration drilling at the KZK Project during 2017. Elements analyzed for all DDHs include Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb and Se. COAs are listed in alphanumeric order, with the first page of each COA indicated in the Page Number column in Table S-1 below.

Table S-1: Table of contents for COAs in this appendix

Certificate	Elements Assayed	Drill holes	Target	Samples (#)	Page Number
VC172527	Au, Ba, Cu, Fe, Pb, S, Zn, As, Sb, Bi, Hg, Se, Ag	K17-420	ABM	15	1
VC172528	Au, Ba, Cu, Fe, Pb, S, Zn, As, Sb, Bi, Hg, Se, Ag	K17-422	ABM	28	4
VC172529	Au, Ba, Cu, Fe, Pb, S, Zn, As, Sb, Bi, Hg, Se, Ag	K17-424	ABM	11	7
VC172530	Au, Ba, Cu, Fe, Pb, S, Zn, As, Sb, Bi, Hg, Se, Ag	K17-430	ABM	10	10
VC172531	Au, Ba, Cu, Fe, Pb, S, Zn, As, Sb, Bi, Hg, Se, Ag	K17-437	Krakatoa	13	13
VC172531R	Au, Ba, Cu, Fe, Pb, S, Zn, As, Sb, Bi, Hg, Se, Ag	K17-437	Krakatoa	3	16
VC172817	Au, Ba, Cu, Fe, Pb, S, Zn, As, Sb, Bi, Hg, Se, Ag	K17-442	Exploration	1	18

Pages: Page 1 to 3
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
15	G_LOG02	Pre-preparation processing, sorting, logging, boxing
15	G_WGH79	Weighing of samples and reporting of weights
15	G_PRP89	Weigh, dry,(up to3.0 kg) crush to 75% passing 2 mm, split 250 g, pulverize to
1	G_SCR34	Wet Screening 75µm, Evaluation of Prep
15	GE_FAA313	@Au, FAS, AAS, 30g-5ml(Final Mode)
15	GO_ICP90Q	Sodium Peroxide fusion/ICP-AES, single element
15	GE_IC14A	Aqua Regia digestion/ICP-AES finish
15	GE_IC14M	Aqua Regia digestion/ICP-MS finish
15	GE_AAS12E	@ Ag by AAS after Aqua Regia digest, 2g Vol 50

Storage: Pulp & Reject

PULP STORAGE	:	STORE FOR 90 DAYS
REJECT STORAGE	:	STORE FOR 30 DAYS

Pages: Page 1 to 3
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
11	G_LOG02	Pre-preparation processing, sorting, logging, boxing
11	G_WGH79	Weighing of samples and reporting of weights
11	G_PRP89	Weigh, dry,(up to3.0 kg) crush to 75% passing 2 mm, split 250 g, pulverize to
11	GE_FAA313	@Au, FAS, AAS, 30g-5ml(Final Mode)
11	GO_ICP90Q	Sodium Peroxide fusion/ICP-AES, single element
11	GE_IC14A	Aqua Regia digestion/ICP-AES finish
11	GE_IC14M	Aqua Regia digestion/ICP-MS finish
11	GE_AAS12E	@ Ag by AAS after Aqua Regia digest, 2g Vol 50

Storage: Pulp & Reject

PULP STORAGE	:	STORE FOR 90 DAYS
REJECT STORAGE	:	STORE FOR 30 DAYS

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Date: November 24, 2017

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.: PO# BMC17-01021
Project No.: KZK
Samples: 94
Received: Oct 23, 2017
Pages: Page 1 to 12
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
94	G_LOG02	Pre-preparation processing, sorting, logging, boxing
94	G_WGH79	Weighing of samples and reporting of weights
11	G_WSH78	Barren wash between each sample - pulverizing stage
88	G_PRP89	Weigh, dry,(up to3.0 kg) crush to 75% passing 2 mm, split 250 g, pulverize to
2	G_SCR34	Wet Screening 75µm, Evaluation of Prep
94	GE_FAA313	@Au, FAS, AAS, 30g-5ml(Final Mode)
94	GO_ICP90Q	Sodium Peroxide fusion/ICP-AES, single element
94	GE_IC14A	Aqua Regia digestion/ICP-AES finish
94	GE_IC14M	Aqua Regia digestion/ICP-MS finish
94	GE_AAS12E	@ Ag by AAS after Aqua Regia digest, 2g Vol 50
2	GO_FAG313	Ag FAS, Gravimetric, 30g
4	GO_XRF77B	Pyrosulphate fusion, XRF Base Metal package (0.2g)

Storage: Pulp & Reject

PULP STORAGE	:	STORE FOR 90 DAYS
REJECT STORAGE	:	STORE FOR 30 DAYS

QA/QC REPORT

DATE: 05 February 2018

PROJECT: **Kudz Ze Kayah**

CLIENT: **BMC Minerals No. 1**

PERIOD OF WORK: 17 June -17 November 2017

SUMMARY

This report summarizes and discusses the results of the field-based quality assurance / quality control (QA/QC) program for the 2017 drill campaign at Kudz Ze Kayah (KZK), and applies to the following work orders:

- VC172527
- VC172528
- VC172529
- VC172530
- VC172531
- VC172531R
- VC172817
- VC173045
- VC173475
- VC174016
- VC174016R

During the 2017 assay program there was one instance of significant blank contamination and one instance of assay accuracy failure for gold. In both instances, the affected sampled were re-assayed, resulting in a pass.

INTRODUCTION

This report discusses the results of the field-based quality assurance / quality control (QA/QC) program for the 2017 drill campaign at the Kudz Ze Kayah (KZK) Project. The QA/QC program includes insertion of certified standard and blank material into the sample stream to monitor accuracy and contamination, and analysis of field and preparation duplicates to monitor precision of the sampling and analytical process. In total, 15% of all samples submitted to the lab are for QAQC purposes (1 standard, 1 blank, 1 duplicate in every batch of 20 samples), consistent with best practise recommendations (Abzalov, 2008; Sketchley, 1998). Sample failures and corrective measures are summarized in Table 1 at the end of this report.

PROCEDURES

Samples were shipped in rice sacks sealed with individually numbered security straps to SGS Mineral Services Geochemistry Vancouver in Burnaby, BC ("SGS Vancouver" or "SGS") for geochemical analysis of base (Cu, Pb, Zn) and precious (Ag, Au) metals for use in the resource calculation, as well as Fe and several other major and trace elements (As, Ba, Bi, Hg, S, Sb, Se). SGS Vancouver is an ISO 9001:2008 certified laboratory (accredited laboratory No. 744) that also conforms with the requirements of CAN-P-1579, CAN-P-1578 and CAN-P-4E (ISO/IEC 17025-2005) for the analytical methods used on the 2016 KZK Project. Accreditation details were provided in the 2015 QA/QC review (Voordouw, 2016a).

Prior to analysis, samples were weighed, dried and crushed to 75% passing 2 mm, with a 250 g split pulverized to 85% passing 75 microns. Gold was analysed by 30 g fire assay with an AAS finish and silver analysed by ICP with an AAS finish on a two-gram 2-acid digest aliquot (Table 1). Gold and silver over limits were triggered at Au >5 g/t and Ag >250 g/t respectively, resulting in re-analysis using a 30 g fire assay with gravimetric finish. Copper, lead, zinc and iron assays were done with Na_2O_2 fusion and ICP-AES analysis. This fusion results in complete digestion of the sample and so provides a near total chemical analysis. Arsenic, Bi, Hg, S, Sb and Se were analysed by ICP-MS on a two-acid aqua regia digest of 3:1 HCl:HNO_3. A smaller aliquot was used for samples with relatively high Ba and S, in order to prevent the precipitation of Pb along with $BaSO_4$. Samples with >4% Ba and low base metals were fused with pyrosulphate and analysed by XRF.

Table 1: Overview of analytical methods used by SGS for analysis of the 2017 samples

Element	SGS		
	Code	*Range*	*Method*
Ag <250 ppm	GE_AAS12E	0.3–300 ppm	2-acid digest, AAS
Ag >250 ppm	GO_FAG313	10–3000 ppm	FA, GRAV

Bi	GE_ICM14B	0.02–10000 ppm	AR digest, ICP-AES, -MS
Hg	GE_ICM14B	0.01–10000 ppm	AR digest, ICP-AES, -MS
S	GO_ICP90Q	0.01–30%?	Na_2O_2 fusion, ICP-AES
Sb	GE_ICM14B	0.05–10000 ppm	AR digest, ICP-AES, -MS
Se	GE_ICM14B	1–1000 ppm	AR digest, ICP-AES, -MS

RESULTS

Certified standard materials (CSMs)

Certified standard materials (CSM or “standards”) were inserted into the sample stream at a rate of 5% or one for every 20 samples. Analytical results are plotted on a Shewhart Control Chart that illustrates the relation of each CSM to the certified assay values provided by the manufacturer. The difference between assayed and certified values is quantified as a Z-score, which indicates the number of standard deviations (σ) that each certified standard assay plots above (+ve values) or below (-ve values) the certified mean. Z-score values of ±2 are referred to as the “warning limits” whereas ±3 is the control limit that may trigger follow-up action.

There was one 3σ CSM failure for Au (B00267920) during the 2017 drilling program, which resulted in a re-assay for the affected sample set. On re-assay, the failed sample returned below 2σ error for Au. There were no 2σ CSM failures during the 2017 drilling program.

Table 2: Certified means and standard deviations (SD) for CRMs used in 2015 KZK Project

CRM Name	Ag (ppm)		Au (ppm)		Cu (%)		Fe (%)		Pb (%)		Zn (%)	
	Mean	*SD*	*Mean*	*SD*	*Mean*	*SD*	*Mean*	*SD*	*Mean*	*SD*	*Mean*	*SD*
CDN-ME-1311	44.9	1.1	0.839	0.033	0.468	0.011			0.303	0.006	1.12	0.02

OREAS 113					13.3	0.5	28.0	2.1	0.025	0.001	0.4158	0.0196

Notes: blank cells = not certified;

Blanks

Field blanks consist of landscaping stone acquired from Premier Horticulture Ltd. and were inserted at a rate of 5% or one for every 20 samples. Ten of these blank samples were calibrated in 2015 (Voordouw, 2016b) and are considered acceptable for use as field blank material for ore grade assay. Analyses of blank material are plotted, together with all core samples, in order that they were analysed so as to best visualize any links between contamination and batches with high-grade samples. Control limits are commonly set at 5x the detection limit, although higher limits can be used based on the actual concentration of said element in the blank and the abundance that constitutes ore grade.

With the exception of one, all blanks returned below 5x detection limit for Au, Ag, Cu, Pb, Fe, and Zn for the 2017 drilling program. One sample (D00004570) returned over 5x detection limit for Fe and Pb and over 10x detection limit for Ag and Zn, indicating significant contamination. Based on this result, the affected sample set was re-assayed. The re-assayed blank material returned below 5x detection limit valued for Au, Ag, Cu, Pb, Fe, and Zn.

Table 3: Detection and mineralized limits for selected precious and base metals

Statistic	Ag	Au	Cu	Fe	Pb	Zn

Table 1: 2017 KZK geochemistry QA/QC failures

Sample	Certificate	Hole ID	Problem	Corrective Action
B00267920	VC174016	K17-450	3σ CSM failure	Re-assay B00267911-B00267917, B00267920
D00004570	VC172531	K17-437	Multi-element blank failure (contamination)	Re-assay D00004568-D00004570

DEFINITIONS

Z- or standard score

The Z-score is a measure of the difference between the actual assay value of a certified standard material (CSM) and the certified assay value of that CSM, expressed as:

$$Z\ score = \frac{CSM\ assay\ value\ (X) - Mean\ certfied\ assay\ value\ (\mu)}{Certified\ standard\ deviation\ (\sigma)}$$

Plotting of Z-scores on Shewhart Control Charts, rather than absolute difference, allows comparison of several CSMs on the same chart.

The following criteria are used to trigger further investigation:

- One CSM plotting outside the control limits
- 2 of 3 consecutive CSM samples plotting beyond the warning limits
- 7 or more consecutive CSM samples plotting above or below the mean
- 5 or more consecutive CSM samples increasing or decreasing, indicating a trend

Appendix V: Drill Core Hyperspectral Imaging Data

This appendix contains short wave infrared (SWIR) spectral data from drill core analyzed during 2017.

Table W-1: Drill core TerraSpec interpreted mineralogy (The Spectral Assisstant)

Table W-3: Column Decriptions

Column Name	Explanation
Min1 sTSAS	The primary mineral identified by The Spectral Assistant™
Wt1 sTSAS	Proportion of the spectrum explained by the primary mineral, out of 1
Min2 sTSAS	The secondary mineral identified by The Spectral Assistant™
Wt2 sTSAS	Proportion of the spectrum explained by the secondary mineral, out of 1
Min3 sTSAS	The tertiary mineral identified by The Spectral Assistant™
NIL Stat sTSAS	The proportion of the spectrum not explained by any mineral in the spectral library
Error sTSAS	A standardized measure of the error on the calculated mineral assemblage relative to the measured spectrum, based on the sum of squares method.
w1485	The wavelength of the peak absorption of the 1485 nm absorption feature, if present
width1485	The range of wavelengths that the 1485 nm absorption feature affects relative to the white reference calibration spectrum, if present
hqd1485	The hull difference quotient (a measure of the depth of the absorption feature) of the 1485 nm absorption feature, if present
w1550	The wavelength of the peak absorption of the 1550 nm absorption feature, if present
hqd1550	The hull difference quotient (a measure of the depth of the absorption feature) of the 1550 nm absorption feature, if present
w1900	The wavelength of the peak absorption of the 1900 nm absorption feature, if present
width1900	The range of wavelengths that the 1900 nm absorption feature affects relative to the white reference calibration spectrum, if present
hqd1900	The hull difference quotient (a measure of the depth of the absorption feature) of the 1900 nm absorption feature, if present
w2200	The wavelength of the peak absorption of the 2200 nm absorption feature, if present
width2200	The range of wavelengths that the 2200 nm absorption feature affects relative to the white reference calibration spectrum, if present
hqd2200	The hull difference quotient (a measure of the depth of the absorption feature) of the 2200 nm absorption feature, if present
w2250	The wavelength of the peak absorption of the 2250 nm absorption feature, if present
width2250	The range of wavelengths that the 2250 nm absorption feature affects relative to the white reference calibration spectrum, if present
hqd2250	The hull difference quotient (a measure of the depth of the absorption feature) of the 2250 nm absorption feature, if present
w2350	The wavelength of the peak absorption of the 2350 nm absorption feature, if present
width2350	The range of wavelengths that the 2350 nm absorption feature affects relative to the white reference calibration spectrum, if present
hqd2350	The hull difference quotient (a measure of the depth of the absorption feature) of the 2350 nm absorption feature, if present

Appendix W: Geologist Certificates

GEOLOGIST'S CERTIFICATE
Alexander B. Nielsen
Vancouver, B.C.

I, **Alexander B. Nielsen**, do hereby certify that:

1. I am presently a Project Geologist with Equity Exploration Consultants Ltd. with offices at Suite 1510-250 Howe Street, Vancouver, British Columbia.

2. I am a graduate of Queen's University, Ontario, Canada with a Bachelor of Science (Hons.) degree in Geology in 2009, and a graduate of Simon Fraser University, British Columbia, Canada with a Master of Science degree in Earth Science in 2012.

3. I am a Professional Geologist registered in good standing with the Association of Professional Engineers and Geoscientists of the Province of British Columbia.

4. I am one of the authors of the assessment report *2017 Geological, Geochemical, Geophysical, Diamond Drilling and Geotechnical Program Report on the Kudz Ze Kayah (KZK) Property* prepared for BMC Minerals No. 1 Ltd.

5. Since 2016, I have been a consulting geologist and have been involved in mineral exploration for gold, copper, silver, lead, and zinc in Canada since 2012

6. I was directly involved with the managing and execution of the 2017 exploration program at the KZK Property.

Dated at Vancouver, British Columbia, this 19th day of June, 2018.

Signed and Sealed

Alexander B. Nielsen, M.Sc., P.Geo

GEOLOGIST'S CERTIFICATE

Dillon H.E. Hume
8253 15th Ave
Burnaby, BC, Canada
V3N 1X7

I, **DILLON HUME**, M.Sc., G.I.T., do hereby certify that:

1. I am presently employed as a Project Geologist with Equity Exploration Consultants Ltd, with offices at Suite 1510, 250 Howe Street, Vancouver, British Columbia, Canada.
2. I am a graduate of Simon Fraser University, Burnaby, British Columbia with a Bachelor of Science degree in Earth Sciences in 2015, and a graduate of Simon Fraser University, Burnaby, British Columbia with a Master of Science degree in Earth Science in 2018.
3. I am a Geoscientist in Training (G.I.T.) in good standing with Engineers & Geoscientists British Columbia (EGBC) in the province of British Columbia.
4. Since 2011 I have been seasonally involved in mineral exploration for base metals and gold in Canada and Mexico.
5. I am one the authors of the assessment report titled "*2017 Geological, Geochemical, Geophysical, Diamond Drilling and Geotechnical Program Report on the Kudz Ze Kayah (KZK) Property"* prepared for BMC Minerals LTD.
6. I was involved with and co-managed the 2017 exploration work on the KZK Property from 23 June to 3 October 2017.

Dated 19th June 2018, at Vancouver, British Columbia.

Signed and Sealed: "*Dillon H.E. Hume*"

Dillon H.E. Hume, M.Sc., G.I.T.
