INTRODUCTION

The Vault property is located in the Kluane area of southwestern Yukon. It covers gold-bearing drainages that host placer deposits, mineralized veins and exceptional gold-in-soil geochemical anomalies that may be indicative of a mesothermal deposit. The property is composed of claims that are wholly owned by Strategic Metals Ltd. and claims under option from two arms-length prospecting groups.

This report describes geological mapping and rock and soil geochemical sampling performed by Archer, Cathro & Associated (1981) Limited on behalf of Strategic Metals. Field work was performed from two field camps between August 21 and August 31, 2018. The author participated in the exploration program and interpreted all results from this work. The author's Statement of Qualifications is located in Appendix I, while a Statement of Expenditures appears in Appendix II.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Vault property is located in southwestern Yukon, at latitude 61°31′ north and longitude 139°36′ west on NTS map sheets 115G/05 and 115G/12 (Figure 1). It comprises 180 wholly owned claims and 117 claims that are under option from two arms-length prospecting groups, which collectively cover an area of approximately 5846 hectares (58.46 km^2). The claims are registered with the Whitehorse Mining Recorder in the name of Archer Cathro, which holds them in trust for the owners. Specifics concerning claim registration are given below, while the locations of individual claims are illustrated on Figure 2.

In 2018, access to and from the property was provided by a Bell206L Long Ranger helicopter operated by Capital Helicopters (1995) Limited of Whitehorse from a gravel pit alongside Mile 1118 of the Alaska Highway.

The Vault property lies within the traditional territories of the Kluane (KFN) and White River (WRFN) First Nations. KFN has concluded land claim agreements with Canada and Yukon, but WRFN has not. The property is subject to Class 1 Land Use Notifications.

HISTORY AND PREVIOUS WORK

Placer gold operations have been recorded since 1903 on creeks that drain the property. Official production records are not available prior to 1940, but extensive workings on creeks throughout the area suggest substantial work during two gold rushes: from 1903 to 1904 and in the 1920s and 1930s (Tremblay, 2000). Hard rock exploration in the area began after construction of the Alaska Highway in 1945.

In 1952, independent prospector E. Flynn staked groups of claims around Swede Johnson Creek. Subsequent prospecting and mapping revealed copper-stained float and coal seams on the claims (Flynn, 1953). In late 1952, Flynn's claims were transferred to New Algers Mines Ltd., which had staked the Polaris and Ursus claims in the area (Figure 3). Prospecting by New Algers Mines discovered pyrite, pyrrhotite, chalcopyrite, galena, sphalerite and magnetite in float throughout the area (Tair, 1953). This mineralization is collectively referred to as the Swede Johnson occurrence.

Also in 1952, Teck Exploration Company Ltd. staked the Musketeer and Conwest nickel-copper showings as the Musketeer claim group, part of which is now covered by the current Vault

claims (Figure 3). Geological mapping and prospecting were carried out in 1953, but no results were reported (Vanwermeskerken, 2001).

In 1955, Teck conducted electromagnetic and magnetometer surveys on the Musketeer claims. Several anomalies were defined by the EM survey, but the cause of anomalies was not identified. A resistivity survey was performed to follow up these surveys. Teck concluded the anomalies were linked to weakly disseminated sulphide minerals (Walker, 1955 and 1956).

In 1980 and 1981, Archer Cathro did regional-scale exploration in selected parts of Yukon on behalf of the NAT Joint Venture (NAT JV), which comprised Chevron Canada Limited and Armco Mineral Exploration Ltd. Prior to commencing field work, NAT JV reanalysed over 5,000 previously collected geochemical sample splits for gold, silver, arsenic and lead. A total of 37 soil samples and 81 stream sediment samples were reanalyzed from the area of the current Vault claims, returning up to 1800 ppb and 425 ppb gold, respectively (Archer and Onasick, 1980 and 1981).

From 1982 to 1990, placer and quartz claims were staked along Reed and Swede Johnson creeks. Some quartz claims related to this staking are included in the current Vault property, but the placer claims are independently owned.

In 1983, AGIP Canada Ltd. staked claims north of the Swede Johnson occurrence. No record of work is available and the claims were allowed to lapse.

In 1986, prospector L. Smith re-staked the AGIP claims and performed a trenching program. No results are available for this work.

In 1986, Kluane Joint Venture (KJV), comprised of Chevron Minerals Ltd. and All-North Resources Ltd., staked and optioned claims to form the Arch property, which covered the Musketeer showing and extended north to encompass part of the current Vault property. Later in the year, KJV entered into option agreements with Pak-Man Resources Inc. and Rockridge Mining Corp.

In 1987, Pak-Man Resources, Rockridge Mining and KJV staked additional claims and conducted mapping, soil sampling and rock sampling on the Eugene claims, an area overlapping part of the current Vault claims. Strongly anomalous values (up to 10,000 ppb gold) were returned from three consecutive soils samples over a 75 m strike length, below a quartz-carbonate alteration zone developed in pyroclastic volcanic rocks (Eaton, 1988).

Also in 1987, Reed Creek Joint Venture (RCJV) staked the Valley, Reed, Pump and Swede claims to cover an aeromagnetic anomaly believed to mark a regionally extensive ultramafic sill, similar in age to a sill that hosts nickel-copper-platinum group element (PGE) mineralization at the nearby Wellgreen deposit. Work on the RCJV claims consisted of geological mapping, reconnaissance prospecting and geochemical sampling. Prospecting identified glacially transported ultramafic and gabbro float. Soil and stream sediment sampling returned sporadic gold anomalies (up to 350 ppb gold-in-soil), along with elevated copper, platinum and paladium values (Carne, 1988).

Also in 1987, D.E. Makkonen staked the Toby claims in the headwaters of Reed Creek. A total of 62 soil samples were collected along the ridgeline and on contour lines. The two best samples returned 133 ppb and 125 ppb gold with 350 ppm and greater than 1,000 ppm arsenic, respectively (Makkonen, 1988).

Also in 1987, independent miner Bill Zikos staked the Greg claims which extended onto the southeastern corner of the current Vault property. A prospecting and reconnaissance sampling program was conducted later that year. This program returned up to 104 ppb gold, but all samples were collected from outside of the current property boundary (Davidson, 1988).

In 1988, Pak-Man, Rockridge and KJV prospected around soil geochemical anomalies on the Eugene claims. Float samples yielded up to 5 g/t gold, but chip samples from bedrock returned only 420 ppb gold and 479 ppm arsenic (Eaton, 1988).

From 1990 to 1992, independent miners R. McIntosh and F. Ellis staked and explored the O.K. claims. These claims were sampled by Placer Dome Exploration Ltd. in 1992, returning up to 1425 ppb gold-in-silt, 56 ppb gold-in-soil and 540 ppb gold-in-rock (Tremblay, 2000).

Between 1990 and 1994, L. and G. Smith staked claims in the area and conducted hand trenching, mechanized trenching and drilling on the Glenn, Mary, Graham and Gamble claims (YGS, 2015). No detailed work history or results are available.

From 2000 to 2002, R. McIntosh and F. Ellis, conducted work programs on the Ross property, which included the O.K., Ross, FRM, BO and NJ claims. These programs included prospecting, geochemical sampling and mapping (McIntosh and Ellis, 2000, 2001, 2003). Sampling returned a maximum of 6667 ppb gold from an undescribed rock sample, but all other samples taken returned weakly anomalous values (Tremblay, 2000).

In 2010, Strategic Metals staked the current Vault claims and undertook a prospecting and geochemical sampling program on the property. A total of 14 rock and 679 soil samples were collected. Rock samples yielded strongly anomalous gold and copper results up to 868 ppb and 16,950 ppm, respectively, from separate samples. Soil sampling returned up to 997 ppb gold, including a string of eight consecutive samples ranging from 100 to 515 ppb gold (Chung and Smith, 2011).

In 2011, Alix Resources Corp. signed an option agreement with Strategic Metals. A prospecting and geological mapping program was completed later in the year. Rock samples returned up to 1.03 g/t gold, 13.2 g/t silver and 24.49 % copper (Victorino and Ledwon, 2011). Following the work program, Alix Resources relinquished its option.

In 2015, Government of Yukon and KFN flew airborne magnetic and electromagnetic surveys across the Wellgreen nickel-copper belt, which encompassed the Vault property.

In 2015, Strategic Metals conducted a LiDAR survey over the Vault property in order to obtain more accurate topographic data for the property.

In 2016, Strategic Metals compiled exploration data onto LiDAR images in order to identify prospective areas for future programs.

In 2017, Strategic Metals undertook a prospecting, hand trenching and soil geochemical sampling program on the property. A total of 506 soil, 52 rock and 36 hand trench samples were collected. Soil sampling from the central part of the property returned up to 4380 ppb gold, while samples from the eastern part of the property further outlined an intense 900 by 400 m gold-in-soil anomaly (up to 1120 ppb) (Willms, 2017). A rock sample of sericitic quartz float taken from slumping overburden within the eastern gold-in-soil anomaly returned 8.72 g/t gold.

In 2018, Strategic Metals signed option agreements with two arms-length prospecting groups, adding the quartz claims covering Reed and Swede Johnson Creeks.

GEOMORPHOLOGY AND CLIMATE

The Vault property is situated along the northeastern edge of the Kluane Range about three kilometres east of the Donjek River. Creeks draining the property flow northward into the Kluane River or westward into the Donjek River. All of the streams are part of the Yukon River watershed.

The property is located in the foothills of the St. Elias Mountains and covers the north side of a west-northwesterly trending ridge system. Local terrain is characterized by long steep talus slopes separated by sharp spur ridgelines and deeply eroded creek valleys leading into a broad glacial valley. Elevations on the property range from approximately 820 to 2150 m above sea level (asl). Outcrop is abundant along ridge crests and actively eroded creek cuts, but talus, glacial deposits and thick moss cover bedrock in most other parts of the property.

Treeline on the property is at approximately 1350 m asl. Vegetation consists of stunted black spruce and thick moss near the valley floor, giving way to willow and black birch on lower slopes, and moss, lichen and grass on stable upper slopes. The property was glaciated during the Late Pleistocene, with alpine and regional ice sheets migrating northerly to northwesterly, up the Donjek River valley (Duk-Rodkin, 1999). Peak glacial elevation on the property reached approximately 1300 m asl (Kennedy, personal communication, 2017).

The climate is typical of northern continental regions with long, cold winters, truncated fall and spring seasons and short, mild summers. The property is mostly snow free from early June to early September.

REGIONAL GEOLOGY

The Vault property lies along the northeastern edge of the Wrangellia Terrane (WRT), as shown on Figure 4. The WRT represents a Pennsylvanian to Upper Jurassic oceanic plateau composed of metavolcanic, metasedimentary and metaplutonic rocks (Greene, et al, 2005). A continental-scale flood basalt event is the key characteristic of WRT, which can be traced from Vancouver Island to Alaska. The WRT was accreted to the North American craton in the Late Jurassic or Early Cretaceous.

VAULT PROPERTY

FILE: P:/2017/VAULT | DATE: DECEMBER 2017

After Colpron, M. and Nelson, J.L., 2011

In 2003, Gordey and Makepeace completed a Yukon-wide geological compilation that updated lithological unit names in the area. The Yukon Geological Survey (YGS) maintains a website illustrating regional geology, which is periodically updated when new information becomes available (YGS, 2017). The main lithological units are described below in Table I, while regional geology is shown on Figure 5.

Table I – Lithological Units (*Gordey and Makepeace, 2003*)

Unit Name	Age	Map Name	Description
Nikolai	Upper Triassic	UTrN1	Basal conglomerate. Volcanic breccia, pillow lava and conglomerate at base.
		UTrN2	Basalt, andesite. Amygdaloidal basaltic and andesitic flows, with local tuff, breccia, shale and thin-bedded bioclastic limestone (Nikolai Greenstone).
		UTrN3	Minor limestone. Locally includes dark grey phyllite and minor thin grey Middle Triassic limestone.
Kluane Ultramafic Suite	Late Triassic	LTrK1	Mafic to ultramafic intrusions including peridotite and dunite. Sheeny black peridotite, rare dunite (Kluane-type Mafic-Ultramafics Gabbro-Diabase Sills).
		LTrK2	Mafic to ultramafic intrusions including peridotite and gabbro. Medium grey-green, massive, medium-grained pyroxene gabbro and greenstone sills (Maple Creek gabbro).
Kluane Schist	Mesozoic	KK1	Dark purplish brown staurolite-cordierite-biotite hornfels with relict schistose texture; quartz-sericite-chlorite schist; minor quartzite.
Skolai – Hasen Creek	Lower Permian to Carboniferous	CPH1	Fine-grained clastic rocks. Interbedded dark grey and brown-weathered siltstone, mudstone and medium to coarse-grained sandstone; lower part contains volcaniclastic sandstone, tuff and rare basaltic flows; rare dark grey to black chert beds and chert-pebble conglomerate (Hasen Creek Formation).
		CPH2	Carbonate. Light to medium grey, massive to bedded limestone; locally fossiliferous; fossils include corals and crinoids.
Skolai – Station Creek	Carboniferous	CPS5	Volcanic rocks succeeded upward by clastic strata including minor limestone. Laminated to thinly bedded, light grey to light green volcanic tuff and

			volcaniclastic siltstone; local crystal rich tuffs interbedded with fine-grained volcanic ash.

Regional-scale mapping shows the Vault property is underlain by a basement of Carboniferous Station Creek Formation (SCF) volcaniclastic rocks and Permian Hasen Creek Formation (HCF) metasediments. These basement rocks are capped by Triassic Nikolai Formation (NF) flood basalts, and all of these units are intruded by near-coeval northwesterly trending, peridotite to gabbro, sills and plugs belonging to the Kluane Ultramafic Suite (KUS) and Maple Creek Gabbro (MCG).

The rocks within the Kluane Range were deformed during their Jurassic to Cretaceous accretion to North America. Later strain is related to more recent movement on the Denali Fault, a major dextral strike-slip fault, which juxtaposes the Wrangellia and Kluane Schist Terranes. There are numerous folds, thrust faults and high angle faults in the region.

PROPERTY GEOLOGY

Property-scale geological mapping was conducted in 2011 by Alix Resources and in 2018 by Strategic Metals. The following description is based on this mapping, plus work completed by the YGS in the Quill Creek area, which overlaps the Vault property (Israel and Van Zeyl, 2004). Figure 6 illustrates property geology.

Detailed mapping on the Vault property generally agrees with regional-scale mapping. Volcaniclastics of the SCF occur throughout much of the central and eastern parts of the property, which are partially overlain by HCF metasediments. The HCF is made up of mudstone, siltstone, phyllite, schist, slate and localized beds of limestone. These units are capped by NF flood basalts along ridges and peaks. Felsic dykes are intruded along the contacts of NF basalts.

Quartz diorite and peridotite to gabbro sills and dykes of the MCG sporadically intrude all of the stratified units. In the central and northwestern parts of the property, undifferentiated plugs have been mapped near thrust faults.

Faults on the property are largely attributed to Tertiary strike-slip displacement along the Denali Fault and the re-activation of earlier thrust faults, which produced high strain zones and locally increased metamorphic grade. Mapped thrust faults, shear zones and folds on the property typically trend northwesterly, following the orientation of regional structures, while smaller-scale extensional faults strike northeasterly and dip steeply. Thrust faults on the property juxtapose NF basalts with members of the HCF and SCF.

MINERALIZATON

Early stage exploration on the property indicates mineralization is localized within deformational quartz veins and quartz-carbonate stockwork veinlets, some of which have envelopes of carbonate alteration. Gold-bearing veins typically contain fine-grained pyrite with weak limonite

alteration and rare arsenopyrite and chalcopyrite, but, overall, the veins carry few or no sulphide minerals and are not enriched in pathfinder elements typically associated with gold.

Copper mineralization on the property consists of chalcopyrite, malachite and azurite found in proximity to quartz veining within volcanics. This mineralization is attributed to the re-mobilization of copper from regionally enriched volcanics.

Weakly disseminated sulphides are locally present in phyllite, schist and volcanics, but these rocks are not notably enriched in gold.

Quartz-calcite vein float containing coarse visible gold has been recovered from Reed Creek along the entire three kilometre length of the placer operation, with float ranging from fist-sized cobbles to one metre diameter boulders. The source or sources of this gold-bearing float are not known with certainty, but some veins and faulted sediments exposed by the Reed Creek placer operation (Tremblay occurrence) host angular gold (Carne, 1988).

In 2018, a total of 23 rock samples were collected from the property. Rock sample locations are shown on Figure 7, while results for rock samples from recent and historical work are illustrated thematically on Figures 8 through 10 for gold, silver and copper, respectfully.

The 2018 rock sample sites were marked with orange flagging tape labelled with their respective sample number. The location of each sample was determined using a hand-held GPS unit. Sample preparation for 2018 rock samples was carried out by ALS Minerals in Whitehorse and then sent to North Vancouver, where the samples were dried, fine crushed to better than 70% passing -2mm and then a 250 g split was pulverized to better than 85% passing 75 micron. The fine fraction was then analyzed for gold using fire assay followed by inductively coupled plasma-atomic emission spectroscopy analysis (ME-ICP41). An additional 50 g charge was further analyzed for gold by fire assay with inductively coupled plasma-atomic emissions spectroscopy finish (Au-AA24). During geochemical analysis, select screens were checked for visible gold. Rock sample descriptions and Certificates of Analysis for 2018 rock samples can be found in Appendix III and Appendix IV, respectively.

Rock sampling from 2018 tested the gold-bearing potential of the various lithological units found on the property, and did not focus primarily on quartz veining. Overall, samples from all lithological units returned low values for metals of interest.

The two best rock samples from the 2018 program were taken from a single northeasterly trending quartz vein, in the eastern part of the property, which returned 1.735 g/t gold from a 1.65 m chip sample and 1.54 g/t gold from a grab sample. This vein is located roughly 50 m upslope of a sample of quartz float, which was found in 2017 within a small slump and returned 8.27 g/t gold. These vein samples were collected within an intense northwesterly trending gold-in-soil geochemical anomaly (Anomaly A).

In the southeastern part of the property, multiple samples have been collected which exceed 1 g/t gold (up to 2.94 g/t). These samples closely follow the trace of a northwesterly trending thrust fault, and partially overlap a gold-in-soil geochemical anomaly (Anomaly C) found on the

hanging wall side of that fault. Rocks collected from this area in 2017 also returned up to 15.6% copper; however, copper values are not accompanied by high gold values.

In the north-central part of the property a single rock sample, collected along the trace of a northwesterly trending thrust fault, returned 1.73 g/t gold. This sample coincides with a broad 6000 by 1000 m soil geochemical anomaly (Anomaly D).

A fragmented cobble of sulphide-rich ultramafic float collected in 2018 from Swede Johnson Creek returned 3.2% nickel and 9730 ppm copper. Significant gold, silver and copper results from samples collected between 2010 and 2018 are listed below in Table II.

SOIL GEOCHEMISTRY

Soil geochemical surveys have been conducted on the various parts of the Vault property since 1980. In 2018, a total of 381 contour soil samples were collected around the Reed and Swede Johnson Creek drainages.

Soil sample locations were recorded using hand-held GPS units. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. Soil samples were collected from 10 to 60 cm deep holes dug by handheld auger. The soil samples were sent to ALS Minerals in Whitehorse, where they were dried and screened to -180 microns. The fine fractions were then shipped to ALS Minerals in North Vancouver where they were analyzed for 41 elements using an aqua regia digestion followed by inductively coupled plasma combined with atomic emission spectroscopy (ME-ICP41). An additional 30 g charge was further analyzed for gold by fire assay with atomic absorption spectroscopy finish (Au-AA24).

Soil sample locations are plotted on Figure 11, while compiled thematic results for gold and arsenic are plotted on Figures 12 to 13, respectively. Anomalous thresholds and peak values for metals of interest are listed in Table III.

Table III – Soil Geochemical Thresholds

Element	Weak	Moderate	Strong	Peak results	2018 Peak results
Gold (ppb)	≥ 10 < 50	≥ 50 < 100	≥ 100	>10,000	1695
Arsenic (ppm)	≥ 50 < 100	≥ 100 < 200	≥ 200	5990	1105

To date, soil sampling on the property has identified five strongly anomalous northwesterly trending anomalies, which are described as follows.

Anomaly A spans an approximately 2450 by 1000 m area located in the northeastern part of the property. It is cored by a 1000 m long, northwesterly trending cluster of soil samples, which has returned multiple samples exceeding 1000 ppb gold (up to 1120 ppb gold).

Anomaly B is an 1800 by 350 m trend that lies approximately 300 m south of Anomaly A. Nine soil samples from this anomaly returned greater than 100 ppb gold (up to 308 ppb).

Anomaly C is 1600 by 700 m area located in the southeastern part of the property, along a northwesterly trending thrust fault. Recent soil sampling has yielded up to 1015 ppb gold from hanging wall slopes, while historical soil sampling returned greater than 10,000 ppb gold from a string of three strongly anomalous soil samples.

Anomaly D is a 6000 by 1000 m area located in the central part of the claims. This anomaly covers widespread, strongly elevated, gold-in-soil values (up to 1800 ppb). Recent, discontinuous contour soil sampling around a north trending ridge in the centre of the anomaly has returned multiple samples greater than 1000 ppb (up to 1695 ppb) gold, while a historical soil returned 1800 ppb gold. A silt sample taken in a creek directly downslope of the anomaly returned 3600 ppb gold.

Anomaly E lies 1000 m northwest of Anomaly C and is a 2300 by 1000 m area situated along the same northwesterly trending thrust fault as Anomaly B. Contour soil samples taken on slopes and ridges from the hanging wall side of the fault have yielded highly anomalous gold (up to 4380 ppb), copper (up to 1120 ppm) and arsenic (up to 5120 ppm) values. Anomaly E is distinguished from the other soil anomalies by its high arsenic and copper values.

GEOPHYSICS

In 2015, The Government of Yukon and KFN flew airborne magnetic and HeliTEM surveys over a portion of the Kluane Range. From these surveys, First Vertical Derivative (FVD) magnetic data was compiled for the Vault property.

FVD magnetic response is strongly influenced by topography. Magnetic highs occur along peaks and lows along valley bottoms. Superimposed on the topographic effects are a series of northwesterly trends that likely reflect variations in lithologies and possibly demagnetization along thrust faults.

LIDAR SURVEYS

In 2015, Strategic Metals conducted a LiDAR survey over the Vault property. In total, 32 lines were flown at 640 m line spacings. This survey produced elevation contours, a digital elevation model and digital surface model at one metre resolution, along with a LiDAR intensity map. Full details from this survey can be found in Burrell, 2016.

LiDAR imagery, along with compiled historical mapping, identified several prospective features on the Vault property that may represent fault or vein structures. Figure 14 is a LiDAR intensity map showing three of these trends, which coincide with geochemical anomalies.

Linear A, which crosses through the centre of the property, approximately follows the trace of a northwesterly trending thrust fault. This feature coincides with strongly anomalous gold values that are typically found on the hanging wall side of the fault, at Anomaly C and E.

Linear B is a discrete lineament that splays westerly off the northwesterly thrust fault associated with Linear A. This feature is associated with strong gold and arsenic soil geochemical response.

Linear C is located in the eastern part of the property, where a series of northwesterly trending soil lines produced continuous strongly elevated gold values to a maximum of 1120 ppb. Hand trenches dug in 2017 were intended to test this linear, but they did not reach bedrock.

DISCUSSION AND CONCLUSIONS

The Vault property is located within the Kluane Mafic-Ultramafic Belt (KMUB) in western Yukon. The KMUB is host to the former Wellgreen Mine, a nickel-copper-PGE deposit now owned by Nickel Creek Platinum Corp. In June 2017, a measured and indicated resource of 363 Mt grading 0.26% Ni, 0.14% Cu, 0.015% Co, 0.231% Pt, 0.244% Pd and 0.04 g/t Au was published (Wellgreen Platinum, 2017). The deposit is located five kilometres southeast of the Vault property.

The Vault property is situated alongside the Denali Fault, which forms the northern segment of the Coastal Range Megalineament. This large-scale fault complex is host to mesothermal gold deposits, most notably in the Juneau Gold Belt, which has produced over 7 million ounces of gold since 1880. The Kensington Mine, located 70 km north of Juneau, is an actively producing mesothermal deposit with a measured and indicated resource of 2.878 Mt grading 9.29 g/t gold (Beebe, et al, 2018).

Soil sampling done in 2018 successfully expanded on previous geochemical coverage, and to date, five robust geochemical anomalies have been identified on the property. These anomalies are characterized by clusters of very high gold values, with little or no correlation to typical gold pathfinder elements. Numerous strong gold-in-soil results found above peak glacial elevation suggest the source of these geochemical anomalies is not glacially transported material.

DATE: January 2018

Prospecting that followed up soil anomalies in the northeastern part of the property discovered a northeasterly trending, gold-bearing, quartz vein in proximity to gold-bearing quartz float. The orientation of this veining suggests the soil geochemical anomaly originates from northeasterly trending, extensional quartz veins that are developed near northwesterly trending thrust faults. The geological setting, style of mineralization and lack of typical gold pathfinder elements are consistent with mesothermal mineralization.

Limited exploration on the Vault property has not discovered enough mineralization to adequately explain the exceptional soil geochemical results. Most soil anomalies have received little or no follow up prospecting and, where prospecting has been done, it is hampered by thick vegetation, alpine talus slopes and glacial till at lower elevations, which can mask recessive weathering veins or fracture filling zones.

Future work on the property is warranted to further evaluate areas around known geochemical anomalies and increase the confidence of current geochemical targets. This work should include: 1) detailed geological mapping and prospecting to discover more veins and to determine their structural controls; 2) additional soil geochemical surveys in areas with sparse coverage; and 3) diamond drilling to evaluate the most prospective anomalies and showings.

Respectfully submitted,

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

K. Willms, B.Sc., GIT.

APPENDIX I

STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Kelson Willms, geologist, with business addresses in Vancouver, British Columbia and Whitehorse, Yukon Territory and residential address in Vancouver, British Columbia, do hereby certify that:

1. I graduated from the University of British Columbia in 2017 with a B.Sc in Earth and Environmental Sciences.

2. From 2015 to present, I have been actively engaged in mineral exploration in the Yukon Territory and British Columbia.

3. I have interpreted all data resulting from this work.

K. Willms, B.Sc.

APPENDIX II

STATEMENT OF EXPENDITURES

Statment of Expenditures
Vault Property
October 25, 2018

Labour

Employee	Job Description	Hours	Time Period	Rate/hr	Total
Doug Eaton	Sr. Geologist	9	January 1 - September 30	$ 120.00	$ 1,080.00
Heather Burrell	Sr. Geologist	46	January 1 - September 30	$ 111.00	$ 5,106.00
Jack Morton	Geologist	3	January 1 - September 30	$ 96.00	$ 288.00
Kelson Willms	Geologist	96	January 1 - September 30	$ 71.00	$ 6,816.00
Liz Smith	Logistics & Office & Field Labour	24	January 1 - September 30	$ 83.00	$ 1,992.00
Lorna Corbett	Logistics & Office	24	January 1 - September 30	$ 83.00	$ 1,992.00
Martin Kulla	Geologist	88	January 1 - September 30	$ 62.00	$ 5,456.00
Scott Newman	Office & Mapping	1	January 1 - September 30	$ 69.00	$ 69.00
Shawn Slipetz	Expediting	23	January 1 - September 30	$ 69.00	$ 1,587.00
Steve Israel	Sr. Geologist	141	January 1 - September 30	$ 111.00	$ 15,651.00
Tom Lacey	Field Labour	80	January 1 - September 30	$ 53.00	$ 4,240.00
Virginia Cobbett	Office Support	4	January 1 - September 30	$ 69.00	$ 276.00
Wayne Schneider	Logistics & Support	7	January 1 - September 30	$ 98.00	$ 686.00
					$ 45,239.00

Expenses

Field room and board	38 Mandays	$ 80.00	/per day	$ 3,040.00
Whitehorse room and board	2 Mandays	$ 180.00	/ per day	$ 360.00
Archer Cathro Vehicle Rentals - Unit Number - CC1 and CS3				$ 390.00
Capital Helciopters, as attached				$ 18,290.48
AC Provided Jet Fuel - 820L @ 1.40/L				$ 1,144.67
New Era Engineering, as attached				$ 2,875.00
ALS Chemex, as attached				$ 7,866.85
				$ 33,967.00

Total 2018 expenditures	$ 79,206.00

Cost per sample $ 198.02

APPENDIX III

ROCK SAMPLE DESCRIPTIONS

Rock Sample Descriptions Property: Vault

Sample Number:	K291672	UTM:	573318	mE	Nad83, Zone 7
Elevation:	m	UTM:	6823366	mN	
Comments:	Rusty weathered boulder ~20x20cm of strongly altered mafic volcanic rock, ~5% disseminated sulphides, mainly py +/- cpy				
Sample Number:	K291673	UTM:	573337	mE	Nad83, Zone 7
Elevation:	m	UTM:	6823304	mN	
Comments:	Cobble ~15x10cm of quartz vein, spotty malachite on surface, blebs and stringers of cpy throughout, some py as well				
Sample Number:	K291674	UTM:	571727	mE	Nad83, Zone 7
Elevation:	m	UTM:	6824379	mN	
Comments:	Brown weathered quartz vein, disseminated pyrite, cuts through silttone, 15 cm wide, 068/80				
Sample Number:	K291675	UTM:	572886	mE	Nad83, Zone 7
Elevation:	m	UTM:	6823833	mN	
Comments:	Pyrite rich (5% locally) chlorite schist, cut by thin (2-3mm) quartz veins				
Sample Number:	K291676	UTM:	572417	mE	Nad83, Zone 7
Elevation:	m	UTM:	6821593	mN	
Comments:	Thin (1-2 cm) quartz veins within foliated volcaniclastic, blebs of cpy py found within veins and host rocks				
Sample Number:	K291677	UTM:	576474	mE	Nad83, Zone 7
Elevation:	m	UTM:	6819941	mN	
Comments:	Rusty weathered cobble ~15x15cm of gabbro, fracture controlled and disseminated sulphides, mainly py +/- cpy				
Sample Number:	K291678	UTM:	576643	mE	Nad83, Zone 7
Elevation:	m	UTM:	6819962	mN	
Comments:	Rusty boulder, ~30x30cm of foliated mafic volcanic, fine disseminated sulphides, limonite along foliation surfaces, py mainly				

Rock Sample Descriptions Property: Vault

Sample Number:	K291679	UTM:	576892	mE	Nad83, Zone 7
Elevation:	m	UTM:	6820278	mN	
Comments:	Shear hosted quartz veins, shear zone through mafic volcanics, abundant pyrite in wallrock and vein, py +/- aspy				

Sample Number:	K291680	UTM:	576293	mE	Nad83, Zone 7
Elevation:	m	UTM:	6821658	mN	
Comments:	rusty weathered, sheared volcaniclastic; disseminated and stringers of py +/- aspy				

Sample Number:	K291681	UTM:	577596	mE	Nad83, Zone 7
Elevation:	m	UTM:	6820511	mN	
Comments:	Rusty weathered 40x30 cm boulder of quartz vein with sheared dark frags of wallrock, disseminated cpy,py and blebs of cpy				

Sample Number:	K291682	UTM:	576915	mE	Nad83, Zone 7
Elevation:	m	UTM:	6819725	mN	
Comments:	Orange weathered highly altered volcanic cut by at least two gen of qtz veins, smaller early veins ~1mm dark grey qtz with cpy and py within; dark grey patches in rock had fine-grained disseminated sulphide				

Sample Number:	W591987	UTM:	571960	mE	Nad83, Zone 7
Elevation:	m	UTM:	6824331	mN	
Comments:	Black finely laminated phyllitic siltstone with quartz veining (<1cm) throughout, which follow bedding. Silstones host disseminated pyrite throughout silty matrix (5-10%). Bedding undulates, but overall 130/10-60				

Sample Number:	W591988	UTM:	571777	mE	Nad83, Zone 7
Elevation:	m	UTM:	6824227	mN	
Comments:	Light green to grey volcaniclastics with intense purple and orange surficial oxide staining. Volcaniclastics host disseminated and dissemianted blebs of pyrite.				

Rock Sample Descriptions Property: Vault

Sample Number:	W591989	UTM:	571861	mE	Nad83, Zone 7
Elevation:	m	UTM:	6823683	mN	

Comments: Light green volcaniclastics with minor quartz-carbonate veinlets. Fine grained (very fine) chlorite streaks and lenses found within that brecciates volcanics. Very fine grained pyrite disseminations found within the chlorite.

Sample Number:	W591990	UTM:	571980	mE	Nad83, Zone 7
Elevation:	m	UTM:	6822257	mN	

Comments: Intensely oxidized, fine grained, black volcanics hosting disseminated pyrite. Fine grained quartz stockwork veinlets cur throughout (barren). Intense limonite weathering and pyrite pits found within. Surface weathered purple/orange.

Sample Number:	W591991	UTM:	571782	mE	Nad83, Zone 7
Elevation:	m	UTM:	6822039	mN	

Comments: 88 cm chip sample across highly malachite stained volcanics bearing pyrite, chalcopyrite and silvery sulphide (hematite?) Intense red oxidation, and limonite pitting present locally. Hosted between two sheeted quartz veins that cut through the volcanics

Sample Number:	W591992	UTM:	571781	mE	Nad83, Zone 7
Elevation:	m	UTM:	6822037	mN	

Comments: grab sample of copper oxide stained volcanics bearing pyrite, chalcopyrite. Copper oxide hosted between two sheeted quartz veins cutting through volcanics

Sample Number:	W591993	UTM:	573032	mE	Nad83, Zone 7
Elevation:	m	UTM:	6824136	mN	

Comments: Foliated/sheared quartz-chlorite schist hosting disseminated pyrite within. Pyrite occurs as foliated streaks and as independent, undeformed, grains.

Sample Number:	W591994	UTM:	578180	mE	Nad83, Zone 7
Elevation:	m	UTM:	6820719	mN	

Comments: Large quartz vein float, 30x30 boulder in float train, white and grey quartz with epidote, sulphides throughout grey quartz py, aspy

Rock Sample Descriptions Property: Vault

Sample Number:	W591995	UTM:	577210	mE	Nad83, Zone 7
Elevation:	m	UTM:	6820967	mN	
Comments:	small cobble of rusty weathered semi-massive sulphide, mainly py +/- cpy. Found in creek				

Sample Number:	W591996	UTM:	576145	mE	Nad83, Zone 7
Elevation:	m	UTM:	6821527	mN	
Comments:	Siliceous creamy white to grey carbonate/marble float within carbonate float train. Hosts rusty patches of blebby oxidized pyrite (difficult to ID any other sulphide, if any, due to pervasive oxidation). Pyrite also found disseminated throughout along b				

Sample Number:	W591997	UTM:	578468	mE	Nad83, Zone 7
Elevation:	m	UTM:	6820574	mN	
Comments:	Quartz vein with patchy orange weathering and minor patches of oxide. Vein (~1.65m wide) hosts disseminated pyrite locally throughout, with some concentrated clusters. Outcrop of Jean Pautler quartz vein sample that ran 8.72 g/t?				

Sample Number:	W591998	UTM:	578468	mE	Nad83, Zone 7
Elevation:	m	UTM:	6820574	mN	
Comments:	1.65 m chip sample across pyrite bearing quartz vein (same vein as W591997). Vein appears to trend roughly 200/50, but difficult to get exact measurement due to sparse exposure. Hosted within foliated volcanics.

CERTIFICATE OF ANALYSIS WH18215872

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).
ME- MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

CRU- 31	CRU- QC	LOG- 21	PUL- 31
PUL- QC	SPL- 21	WEI- 21	

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au- AA24	Cu- OG46	ME- MS41	ME- OG46

CERTIFICATE WH18215876

Project: VAULT

This report is for 219 Soil samples submitted to our lab in Whitehorse, YT, Canada on 1- SEP- 2018.

The following have access to data associated with this certificate:

HEATHER BURRELL SCOTT NEWMAN	ANDREW CARNE	JACK MORTON

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
SCR- 41	Screen to - 180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
ME- ICP41	35 Element Aqua Regia ICP- AES	ICP- AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH18215878

Project: VAULT

This report is for 168 Soil samples submitted to our lab in Whitehorse, YT, Canada on 1- SEP- 2018.

The following have access to data associated with this certificate:

HEATHER BURRELL SCOTT NEWMAN	ANDREW CARNE	JACK MORTON

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
SCR- 41	Screen to - 180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
ME- ICP41	35 Element Aqua Regia ICP- AES	ICP- AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH18253804

Project: VAULT

This report is for 1 Rock sample submitted to our lab in Whitehorse, YT, Canada on 10- OCT- 2018.

The following have access to data associated with this certificate:

HEATHER BURRELL SCOTT NEWMAN	ANDREW CARNE	JACK MORTON

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND- 02	Find Sample for Addn Analysis

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
Ni- OG46	Ore Grade Ni - Aqua Regia	
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.
